

Google for Startups Cloud AI Program — Complete Analysis and Application Readiness Guide

Prepared for: Antutive (company) and Famant (product)

Analysis date: 28 July 2026

Source: Official Google for Startups Cloud website (cloud.google.com/startup and its sub-pages), the official Google for Startups site (startup.google.com), and the official Google Cloud Startups Program Terms (cloud.google.com/terms/startup-program-tos)

Document status: AI Startup Research and Application Preparation Guide

Prepared by: Independent Google Cloud AI startup-program research analysis

Revision status: Revision 2, issued 28 July 2026. This revision corrects five points in the first issue: Vertex AI is no longer described as legacy and is confirmed as an active Google Cloud product; the treatment of third-party models now distinguishes the regular credit allocation from the separate conditional partner-model credit of up to US\$10,000 in Model Garden for qualifying Scale and Scale AI startups; the institutional-funding conclusion is expressed as a reading of the published criteria rather than as an absolute bar; the company-age inconsistency is now presented as an unresolved conflict with five years adopted as the safer assumption rather than as a determined rule; and the website guidance now separates the small set of items that genuinely matter before applying from the larger set of optional recommendations.

Important validity note: Google states that acceptance is at its discretion and that it may modify programme terms and incentives at any time. Every figure and rule in this report was read from the official pages on 28 July 2026 and must be re-verified immediately before an application is submitted.

Classification key used throughout this report

Label	Meaning
OFFICIAL REQUIREMENT	Explicitly stated as an eligibility or selection requirement on an official Google page
OFFICIAL BENEFIT	Explicitly stated as a programme benefit on an official Google page
OFFICIAL CONDITION	Explicitly stated condition, footnote or contractual term
OFFICIAL LIMITATION	Explicitly stated exclusion, cap, expiry or restriction
RECOMMENDATION	Reasonable application-preparation advice from this analysis, not a Google rule
NOT SPECIFIED	Not clearly specified by Google on the reviewed official pages

3. Executive Summary

The Google for Startups Cloud Program is Google Cloud's global startup programme that provides service credits, technical enablement, business support and partner offers to startups at different stages. Within that programme Google operates a dedicated AI startup offering, documented at cloud.google.com/startup/ai, which increases the maximum credit value available to startups whose primary product is built on Google's AI stack.

What the AI programme is. It is an extension of the Scale tier of the Google for Startups Cloud Program. Google states on cloud.google.com/startup/ai that it is designed for Scale tier AI startups and that qualifying startups may receive up to US\$350,000 in Google Cloud credits over two years, together with access to Google Cloud AI experts, exclusive webinars and Q&A sessions with Google Cloud AI product managers, engineers and developer advocates, insight into Google Cloud's AI roadmap, and access to Google's own models built by Google DeepMind. (OFFICIAL BENEFIT)

Why Google provides it. The commercial logic is visible on the programme's own landing page: Google positions Google Cloud as the platform of choice for AI companies and states that nearly all AI unicorns are Google Cloud customers. The credits reduce the early infrastructure cost of building on Google Cloud so that startups adopt the Google AI stack, and the programme terms explicitly contemplate the company continuing to pay for usage once credits are exhausted. Google does not publish a formal statement of its strategic motivation, so any further reasoning is inference. (NOT SPECIFIED)

Credit levels currently published (verified 28 July 2026).

Tier	Maximum credits	Currency	Period
Start tier (pre-funded)	2,000	USD	Valid for 12 months
Scale tier (standard)	200,000	USD	Over 2 years
Scale tier + AI startup programme	350,000	USD	Over 2 years
Series B+	Credits based on monthly spend, custom	USD	Negotiated, not published

AI-specific benefits. Programme credits cover Google's own models, with Gemini and Gemma named explicitly. Third-party models are billed directly and are not covered by the regular Google Cloud credit allocation. That is not the whole picture, however: the Startup Perks page states that qualifying Scale and Scale AI startups may receive an additional US\$10,000 in credits for partner models in Model Garden, including Anthropic, Mistral and AI21. This is a separate, conditional benefit rather than part of the regular allocation, and it is described in full in section 7. Participants can also use Model Garden for additional model choice. The Scale tier additionally includes US\$12,000 in Enhanced Support credits for one year, US\$500 in Google Skills training credits, twelve months of Google Workspace Business Plus subject to conditions, a US\$600 monthly Google Maps Platform credit for one year subject to a separate application, a dedicated business support contact and Startup Success Manager, and access to Scale-tier-exclusive partner perks. (OFFICIAL BENEFIT)

Major eligibility conditions for the AI programme. Google requires institutional equity funding (pre-seed or seed within the last five years, or Series A within the last twelve months), incorporation within the last five years, no more

than US\$5,000 of Google Cloud credits received previously, and the use of, or a plan to use, Gemini or the Gemini Enterprise Agent Platform as a foundation of the primary product. Google also requires a publicly available company website whose domain matches both the business email used to apply and the email domain associated with the Google Cloud billing account, and an 18-character Google Cloud billing account ID. In the FAQ Google states that inclusion in the AI programme requires being an AI-first startup, meaning AI is part of the company's foundational structure and strategy rather than a bolt-on productivity layer. (OFFICIAL REQUIREMENT)

Relevance to Antutive and Famant. On the product dimension the fit looks plausible. Famant, as described in the supplied company context, places AI at the centre of the product rather than at the edge: an AI family assistant, AI task creation and delegation, family-aware scheduling with conflict detection, document understanding with OCR, expense and budgeting intelligence, and AI-curated dashboards. If those capabilities are genuinely built on Gemini and the Gemini Enterprise Agent Platform, the AI-first characterisation is defensible. On the eligibility dimension the fit cannot be confirmed. The single hardest gate is institutional equity funding. Nothing in the supplied context confirms that Antutive has raised a pre-seed, seed or Series A round from an institutional investor or venture capital firm, and Google explicitly states that angel, friends-and-family, crowdfunding, prize, private-equity and government-innovation-grant funding will not qualify a startup for the Scale tier. Based on the current published eligibility criteria, Antutive would not appear eligible for the Scale AI tier without qualifying institutional or venture capital funding, and the realistic route would in that case be the Start tier at US\$2,000. Final eligibility remains at Google Cloud's discretion, so this should be treated as the likely reading of the published criteria rather than as a closed door.

Major application-preparation steps. Confirm and document legal incorporation and its date; establish a company-domain business email that matches the public website domain; create a Google Cloud account and capture the 18-character billing account ID; publish a credible public website that clearly presents Antutive as an AI product company and Famant as an AI-native product; document the intended Google Cloud and Gemini architecture; produce a defensible cloud-spend forecast; and confirm the funding position, because the funding answer determines which tier is available.

Important uncertainties. Google does not publish how applications are scored, does not publish a list of eligible or ineligible countries, does not publish minimum team size, revenue, user count or traction thresholds, does not publish a requirement for a demo video or screenshots, and does not publish the specific evidence formats it will accept beyond public links to funding information. Google also does not publish a separate GPU or TPU allocation for the startup programme; accelerator usage is simply Google Cloud usage funded from the same credit pool. There is also a documented inconsistency between two official pages on company age, described in section 9.

Major blockers that must be verified before any application. Legal incorporation status and date; whether qualifying institutional equity funding exists; whether Antutive has previously received more than US\$5,000 in Google Cloud credits; whether a public website exists on a domain that matches the business email and the billing account email domain; and whether Antutive's country of primary business is one Google will accept, which Google decides at its discretion.

4. Official Website and Navigation Analysis

The Google for Startups Cloud presence is split across two official domains. cloud.google.com/startup carries the commercial programme detail, tier criteria, benefit footnotes, FAQ and application form. startup.google.com carries the Google for Startups brand layer, including a Cloud overview page and a Gemini enablement page. The legally binding programme terms sit on cloud.google.com/terms. All pages below were accessed on 28 July 2026. Web3-specific pages were deliberately excluded from this analysis in line with the report scope; where a Web3 reference is unavoidable it appears only because Google publishes it inside a shared criteria list.

| Page or section | Official URL | Purpose | Information available | Why it matters to an AI startup | Important findings | Date accessed | | — | — | — | — | — | — | | Startups landing page | <https://cloud.google.com/startup> | Entry point and tier router | Three published routes (Early stage, Pre-funded, Series B+), headline credit figures, an overview of the Google Cloud AI stack, events and report links | Establishes the headline maximum of up to US\$350,000 for AI-first startups and shows which AI products Google is promoting to startups | Confirms US\$200,000 standard and up to US\$350,000 for AI-first at Seed to Series A, and US\$2,000 for pre-funded startups | 28 July 2026 | | AI startup program | <https://cloud.google.com/startup/ai> | Dedicated AI programme page | AI eligibility list, year-by-year credit split, AI expert access, model coverage | The single most important page for an AI applicant; it is the only page that states the AI-specific first-year credit ceiling | States Year 1 at 100% up to US\$250,000 for AI-first startups and Year 2 at 20% up to a further US\$100,000 | 28 July 2026 | | Early stage funded startups (Scale tier) | <https://cloud.google.com/startup/early-stage> | Scale tier criteria and benefits | Selection criteria, full benefit list, all benefit footnotes, exclusions, qualifying and non-qualifying funding types | Defines the tier that the AI programme sits on top of, and defines what funding counts | States the additional US\$150,000 for AI-first qualified startups and lists support, Workspace, Maps and Skills benefits | 28 July 2026 | | Pre-funded startups (Start tier) | <https://cloud.google.com/startup/pre-funded> | Start tier criteria and benefits | US\$2,000 credit, 24-month company age limit, MVP and business-model expectations, AI Studio free tier | The realistic fallback route for an AI startup without institutional equity funding | Start tier credits are valid for 12 months and the company must not have received Google Cloud credits

beyond the free trial | 28 July 2026 | | Frequently asked questions | <https://cloud.google.com/startup/faq> | Official clarifications | Restrictions, tier definitions, application prerequisites, funding verification, decision timelines, email and billing rules, AI-first definition | Contains Google's clearest published statement of what AI-first means and the domain-matching rule | Confirms the AI-first definition, the domain-matching requirement across website, email and billing account, and the support contact address | 28 July 2026 | | Application form, step 1 | <https://cloud.google.com/startup/apply> | Application entry | Contact and company fields, country, industry, job role, and a startup-type selector for AI, Web3 or neither | Shows exactly what Google asks first and confirms that AI is a declared category in the form | Google describes an AI startup in the form as one using AI as its core technology to develop its primary products or solutions | 28 July 2026 | | Startup Perks | <https://cloud.google.com/startup/perks> | Partner offer catalogue | Partner offers grouped by AI infrastructure and tools, databases and analytics, DevOps and other categories, with Scale-tier-exclusive offers marked | Some AI tooling offers are reserved for Scale tier members, which adds value to qualifying for Scale rather than Start | Confirms that Google Cloud and Firebase costs are the covered spend, and that starred perks are Scale-tier exclusive | 28 July 2026 | | Startup resources and guides | <https://cloud.google.com/startup/resources> | Enablement hub | Gemini building tools, training, accelerators, Startup School, Google Skills, go-to-market programmes, events | Identifies free enablement an applicant can use before and during the programme, and identifies the separate AI Futures Fund equity route | Confirms that Google runs a separate equity-funding vehicle for AI founders, distinct from cloud credits | 28 July 2026 | | Series B+ | <https://cloud.google.com/startup/series-b> | Later-stage route | Custom agreements, dedicated customer engineers, spend-based credits, learning credits | Context only; establishes that published credit ceilings stop at Series A and later-stage support is negotiated | No published credit amounts; entry is via contacting sales | 28 July 2026 | | Google for Startups Cloud overview | <https://startup.google.com/cloud/> | Brand-level programme overview | Start and Scale summaries, AI and Web3 benefit summaries, and a short list of basic application requirements | Contains the clearest published list of baseline application prerequisites, including the public website requirement | Lists a public company website, a matching company email domain, a Google Cloud account and billing ID, and a company-age rule that differs from the Scale tier page | 28 July 2026 | | Gemini for Startups | <https://startup.google.com/gemini/> | Gemini enablement | Gemini Kit contents, AI Studio and Gemini API access, Firebase Studio, training, Gemini API Sprints, Gemini Startup Forum | Shows the AI enablement available before any credits are granted, useful for building the product evidence an application benefits from | Confirms that prototyping in AI Studio and getting a Gemini API key does not require the startup programme | 28 July 2026 | | Google Cloud Startups Program Terms | <https://cloud.google.com/terms/startup-program-tos> | Binding programme agreement | Definitions, incentive mechanics, conditions, term, termination, confidentiality, investor disclosure, governing law | The controlling document on what credits legally are, when they expire and what obligations the company accepts | Confirms credits are non-transferable, non-refundable, not redeemable for cash, expire on a stated Credit Expiration Date, and that the company pays all usage beyond the credits | 28 July 2026 |

Navigation structure observed. The startup section of cloud.google.com uses a consistent secondary navigation bar with the following items: Startups, Pre-Funded, Early Stage, Series B+, Perks, Success stories, FAQ, Resources and Apply. The AI startup page is not present in that navigation bar. It is reachable from the AI benefits link on startup.google.com/cloud and directly at cloud.google.com/startup/ai. This is a practical finding for applicants: the page that contains the AI-specific credit ceiling is not surfaced in the main startup navigation, so an applicant browsing only the visible menu may never see the US\$250,000 first-year AI figure.

5. AI Startup Program Overview

Purpose of the programme. Google describes the Google for Startups Cloud Program in its FAQ as a programme that supplies financial, business, technical and community resources to startups at all stages of development, and that helps them build products and infrastructure on Google Cloud using credits and special offers. The AI startup programme is presented as a layer on top of that, built specifically to accelerate AI startups. (OFFICIAL BENEFIT)

Types of AI startups supported. The AI programme page frames the target company as one that uses, or plans to use, the Gemini Enterprise Agent Platform or Gemini to deploy AI services as a foundation of its primary product or solution offering. The application form frames it as a startup using AI as its core technology to develop its primary products or solutions. The FAQ frames it as an AI-first startup, with AI built into the company's foundational structure and strategy rather than acting only as a productivity or bolt-on layer. Read together, these three statements point at product-level AI dependency rather than internal AI usage. (OFFICIAL REQUIREMENT)

Startup stages supported. The AI programme is explicitly scoped to the Scale tier. Google states it is for venture-capital-funded startups ready to grow and scale, and defines the funding window as pre-seed or seed rounds within the last five years and Series A rounds within the last twelve months. Pre-funded AI startups are not excluded from Google Cloud, but they are routed to the Start tier and its US\$2,000 credit rather than to the AI programme. (OFFICIAL REQUIREMENT)

Is the programme global? Google does not publish a list of eligible countries on any of the reviewed pages. The application form does collect a country field and a business phone country code, so country is captured at application time. The programme terms state that Google has sole discretion to approve or reject an application, and expressly name the geographic region or country of the company's primary place of business as an example of a reason for rejection. The honest conclusion is that the programme is marketed globally but geographic acceptance is discretionary and unpublished. (OFFICIAL CONDITION for the discretion; NOT SPECIFIED for any country list)

Funding-stage requirements. For the AI programme and the Scale tier, Google requires recent startup equity funding from an institutional investor or venture capital firm. Google states that equity investment vehicles

supporting startup growth from institutional investors and venture capital firms qualify, and that Simple Agreement for Future Equity instruments are eligible. Google separately states that funding through private equity, government innovation grants, prize funding, crowdfunding, angel investment, and friends-and-family investment will not qualify a startup for Scale, although such startups may be evaluated for other tiers. In the FAQ Google confirms that crowdfunding, angel and friends-and-family funded startups may be evaluated for the Start tier. (OFFICIAL REQUIREMENT and OFFICIAL LIMITATION)

Product requirements. For the Start tier Google describes the target as a digital-native technology startup with a working minimum viable product, a clear business model and an intention to seek venture funding soon, and expressly excludes service agencies, consultancies and traditional small businesses. For the Scale tier and the AI programme, Google’s product requirement is expressed through the AI-first and Gemini-foundation language rather than through a development-stage threshold. Google does not publish a minimum product maturity requirement for the Scale tier. (OFFICIAL REQUIREMENT for Start tier MVP; NOT SPECIFIED for Scale tier product maturity)

Difference between the AI programme and the standard programme. The difference is not a separate application and not a separate legal agreement. It is a benefit uplift inside the same programme. The standard Scale tier provides first-year coverage of 100% of Google Cloud and Firebase usage up to US\$100,000. The AI uplift raises first-year coverage to 100% of usage up to US\$250,000. Both share the same second-year structure of 20% of usage up to a further US\$100,000. The Scale tier page expresses the same uplift as US\$200,000 in base credits plus US\$150,000 in additional credits for AI-first qualified startups. The AI programme also adds AI expert access, AI-specific webinars and Q&A sessions with Google Cloud AI product managers, engineers and developer advocates, and roadmap insight. (OFFICIAL BENEFIT)

Must AI be the core product? Yes, based on Google’s own wording. All three official formulations describe AI as core, foundational or primary. Google states that inclusion in the AI programme requires AI to be part of the startup’s foundational structure and strategy and not merely a productivity or bolt-on layer, and it states that applications are reviewed case by case at Google Cloud’s discretion. (OFFICIAL REQUIREMENT)

Is calling an external AI API sufficient? Google does not answer this directly. Google’s language centres on whether AI is foundational to the product, not on which integration pattern is used, and the AI programme page explicitly accepts startups that use or plan to use Gemini or the Gemini Enterprise Agent Platform, which are consumed as managed services rather than self-hosted models. A defensible reading is that consuming Gemini through a managed API can satisfy the requirement provided the product genuinely depends on it, but Google does not confirm this and any startup where AI is a thin wrapper risks the bolt-on characterisation. (NOT SPECIFIED)

Is AI infrastructure usage considered? Google does not publish an infrastructure-spend threshold or an infrastructure-based qualification test. Google does state that credits cover its own state-of-the-art models such as Gemini and Gemma, and that third-party models are billed directly and are not covered by the regular credit allocation, subject to the separate conditional partner-model credit for eligible Scale and Scale AI startups described in section 7. It also promotes its AI Hypercomputer, TPUs and GPUs to startups. There is no published statement that a startup must consume accelerators to qualify. (NOT SPECIFIED)

## 6. AI Startup Tracks, Tiers and Stages									
Google publishes two application-based tiers that an AI startup can realistically target, plus a later-stage route that is negotiated rather than published. The AI programme is an uplift applied to the Scale tier and is not a standalone tier. The table below compares only the routes relevant to an AI startup.									
Attribute	Start tier (pre-funded)	Scale tier (standard)	Scale tier with AI startup programme		—		—		Official name Start tier
Scale tier	AI startup program, applied to Scale tier		Intended startup stage	Pre-funded, digital-native, working MVP, intending to raise venture funding soon		Pre-seed to Series A, institutionally funded		Pre-seed to Series A, institutionally funded, AI-first	AI-product requirement
None stated	None stated		Uses or plans to use Gemini or the Gemini Enterprise Agent Platform as a foundation of the primary product or solution; AI must be foundational, not bolt-on		Funding requirement	Not funded with qualifying startup equity		Recent startup equity funding from an institutional investor or venture capital firm; pre-seed or seed within five years, Series A within twelve months; SAFEs eligible	Same as Scale tier
	Company age		Founded within the last 24 months		Founded within the last five years		Founded within the last five years		Prior Google Cloud credits
	Must not have received Google Cloud credits beyond the free trial		Must not have received more than US\$5,000 in Google Cloud credits		Maximum Google Cloud credits		US\$2,000		US\$200,000
	Up to US\$350,000		First-year credit coverage		US\$2,000, valid for 12 months		100% of Google Cloud and Firebase usage up to US\$100,000		100% of Google Cloud and Firebase usage up to US\$250,000
	Second-year credit coverage		Not applicable		20% of usage up to an additional US\$100,000		Percentage of costs covered		Not expressed as a percentage
	Year 1 100%, Year 2 20%		Year 1 100%, Year 2 20%		Gemini benefits		Free-tier AI Studio access; credits cover proprietary Google models		Credits cover Google models including Gemini and Gemma
	Credits cover Google models including Gemini and Gemma		Credits cover Google models including Gemini and Gemma; access						

to Google DeepMind models; Model Garden access | | Agent platform benefits | Not stated for this tier | Credits usable for the Gemini Enterprise Agent Platform | Credits usable for the Gemini Enterprise Agent Platform, which Google names as the qualifying platform for the AI programme | | GPU and TPU benefits | Not separately stated | Not separately stated; accelerator usage is Google Cloud usage funded from the credit pool | Not separately stated; accelerator usage is Google Cloud usage funded from the credit pool | | Technical support | Not stated | US\$12,000 in Enhanced Support credits for one year | US\$12,000 in Enhanced Support credits for one year | | Startup Success Manager | Not stated | Dedicated business support and success manager | Dedicated business support and success manager | | Mentorship and expert access | Technical resources and global startup community | Google Cloud engineers, exclusive events and networks | Google Cloud AI expert availability, exclusive AI webinars and live Q&As with AI product managers, engineers and developer advocates, AI roadmap insight | | Training benefits | US\$200 in Google Skills credits | US\$500 in Google Skills credits | US\$500 in Google Skills credits, plus AI-specific training and webinars | | Google Workspace benefits | 12 months of free Google Workspace Business Plus, subject to conditions | 12 months of free Google Workspace Business Plus, subject to conditions | 12 months of free Google Workspace Business Plus, subject to conditions | | Google Maps benefits | Not stated | US\$600 monthly Google Maps Platform credit for one year, separate application required | US\$600 monthly Google Maps Platform credit for one year, separate application required | | Partner perks | Exclusive partner offers and perks | Additional partner offers, including Scale-tier-exclusive perks | Additional partner offers, including Scale-tier-exclusive perks | | Application route | cloud.google.com/startup/apply | cloud.google.com/startup/apply | cloud.google.com/startup/apply, selecting the AI startup option | | Important conditions | Credits valid 12 months; excludes service agencies, consultancies and traditional small businesses | Funding must be verifiable through public online sources; stealth companies must have funding verified by their investor | AI-first status assessed case by case at Google Cloud's discretion | | Important restrictions | Third-party models billed directly and not covered by the regular credit allocation | Credits not usable for third-party services or Google Cloud Marketplace offerings; a separate conditional partner-model credit of up to US\$10,000 in Model Garden may be available to qualifying Scale startups | Third-party models billed directly and not covered by the regular credit allocation; a separate conditional partner-model credit of up to US\$10,000 in Model Garden, covering partners including Anthropic, Mistral and AI21, may be available to qualifying Scale AI startups | | Official source | <https://cloud.google.com/startup/pre-funded> | <https://cloud.google.com/startup/early-stage> | <https://cloud.google.com/startup/ai> |

Tier assignment is decided by Google, not by the applicant. Both tier pages state that startups will be matched with the tier and benefits that best suit their stage. The application form asks the applicant to declare whether they are an AI startup, a Web3 startup or neither, but the tier outcome follows Google's assessment. (OFFICIAL CONDITION)

Series B+ route, for context only. Google publishes no credit amounts for Series B+ startups. The published offer is partner services funds, flexible and enterprise agreements, dedicated customer engineers, credits based on monthly spend, personalised migration estimates and learning credits, accessed by contacting sales. This route is out of scope for Antutive at its current stage.

Separate AI equity route, for context only. On its startup resources page Google links an AI Futures Fund described as an equity-funding vehicle to support founders building next-generation AI products. This is distinct from cloud credits and is a separate application. It is noted here only so that the difference between credits and investment is clear; it was not analysed in depth for this report. (OFFICIAL BENEFIT of a separate programme)

7. Cloud Credits and Financial Benefits

WARNING — WHAT THESE CREDITS ARE NOT

Google Cloud credits are service credits. They are not direct cash funding or an equity investment unless explicitly stated otherwise by Google. The Google Cloud Startups Program Terms state that incentives are not transferable, not refundable, not redeemable for cash, and may not be sold, purchased or bartered. They offset qualifying Google Cloud usage fees only. Antutive must not model them as revenue, as a bank balance, or as capital available for salaries, marketing or any non-Google-Cloud cost.

Maximum credits available to an AI startup. Up to US\$350,000 over two years, for a startup that qualifies for the Scale tier and is additionally accepted into the AI startup programme. (OFFICIAL BENEFIT, source cloud.google.com/startup/ai and cloud.google.com/startup)

Entry-level credits. US\$2,000 for the Start tier, valid for 12 months. (OFFICIAL BENEFIT, source cloud.google.com/startup/pre-funded)

First-year credit coverage. For the standard Scale tier, Google covers 100% of Google Cloud and Firebase usage up to US\$100,000 in year one. For AI-first startups, Google covers 100% of usage up to US\$250,000 in year one. (OFFICIAL BENEFIT, source cloud.google.com/startup/ai)

Second-year credit coverage. Google covers 20% of Google Cloud and Firebase usage in year two, up to an additional US\$100,000 in credits. This applies to both the standard and the AI-uplifted Scale tier as published. The practical consequence is significant and often missed: to consume the full US\$100,000 of second-year credits a startup would need to generate approximately US\$500,000 of year-two Google Cloud usage, because only one fifth of usage is covered. (OFFICIAL BENEFIT and OFFICIAL LIMITATION)

Reconciliation of the published figures. US\$250,000 in year one plus US\$100,000 in year two equals the US\$350,000 headline. The Scale tier page expresses the same total as US\$200,000 in base credits plus US\$150,000 in additional credits for AI-first qualified startups, and its footnote adds that the additional US\$150,000 supports

product development using the Gemini Enterprise Agent Platform. Both descriptions reconcile to US\$350,000. (OFFICIAL BENEFIT)

Credit-validity period. Start tier credits are stated to be valid for 12 months. Scale tier credits are described as covering two years. The binding terms are more precise and less generous in tone: credits may be issued in increments at Google’s discretion and expire on the Credit Expiration Date specified by Google in writing at issuance or shown in the company’s Cloud console or billing dashboard. Any incentive coupon expires if not redeemed by the deadline Google communicates. Antutive must therefore read the actual expiry date in its own billing console rather than assume a clean 24-month window. (OFFICIAL CONDITION)

Eligible Google Cloud services. Google states that credits can be applied toward Google Cloud services and select Google Cloud offerings, and in the FAQ names BigQuery and the Gemini Enterprise Agent Platform as examples. The Perks page and the startup.google.com Cloud page both describe the covered spend as Google Cloud and Firebase costs, so Firebase usage is explicitly within scope. (OFFICIAL BENEFIT)

Excluded services and spend. Credits cannot be applied to third-party services or offerings, including those on Google Cloud Marketplace. Third-party models are billed directly and are not covered by the regular programme credit allocation, subject to the separate partner-model benefit set out immediately below. Google Workspace, Google Maps Platform and Google Ads are handled as separate benefits rather than as credit-eligible spend; Google states that any Workspace and Maps Platform benefits are detailed in the programme welcome email, and that the Maps benefit requires a separate application. (OFFICIAL LIMITATION)

Separate partner-model credit, which must not be confused with the regular allocation. The statement that third-party models are not covered is accurate for the regular Google Cloud credit allocation, but it is not an absolute statement about the programme as a whole. The Startup Perks page states that qualifying Scale and Scale AI startups may receive an additional US\$10,000 in credits for partner models available in Model Garden, including Anthropic, Mistral and AI21. Two distinct things are therefore in play, and the application and the cloud-spend forecast should keep them apart. (OFFICIAL BENEFIT, conditional)

Benefit	What it covers	Who can receive it	How it should be treated
Regular programme credits	Eligible Google Cloud and Firebase services, and Google’s own models such as Gemini and Gemma	All accepted startups, at the level of their tier	The primary allocation, and the basis of the spend forecast in section 22
Partner-model credit, up to US\$10,000	Partner models in Model Garden, with Anthropic, Mistral and AI21 named	Qualifying Scale and Scale AI members only, conditionally	A separate, conditional benefit. It should not be assumed, should not be added to the headline figure, and should be confirmed with Google before it is relied on

Antutive should therefore not write, and should not plan on the basis of, an absolute statement that third-party models are never covered. The correct position is that they fall outside the regular allocation, and that a separate conditional partner-model benefit may be available if Antutive qualifies for the Scale or Scale AI tier. Because this benefit is conditional and is published on the Perks page rather than in the core eligibility criteria, it should be re-verified immediately before applying and should not be treated as guaranteed.

Is Gemini usage covered? Yes. Google states that programme credits cover its own state-of-the-art models, naming Gemini and Gemma. (OFFICIAL BENEFIT)

Is agent-platform and model-development usage covered? Yes. The FAQ names the Gemini Enterprise Agent Platform as an example of a Google Cloud service the credits can be used for. (OFFICIAL BENEFIT)

Note on Vertex AI branding. The report scope asked specifically about Vertex AI. On the startup programme pages reviewed on 28 July 2026, the platform for building, deploying and managing models and agents is presented under the name Gemini Enterprise Agent Platform, together with Model Garden, Google AI Studio and Firebase Studio, and the name Vertex AI did not appear on those particular pages. This must not be read as Vertex AI having been retired. Google currently references both Gemini-related platforms and Vertex AI across its official Cloud ecosystem, including Vertex AI Model Garden, and the Google for Startups hub currently mentions both Gemini and Vertex AI. Vertex AI is therefore an active Google Cloud product and should not be described as legacy. Antutive should use the exact current

Google product names that match its planned architecture, and should verify the naming again immediately before applying. Whether Google is consolidating these brands or operating them in parallel is not clearly specified by Google on the reviewed official pages. (NOT SPECIFIED)

Is GPU usage covered? Google does not publish a GPU-specific credit, discount or allocation for the startup programme. GPU and TPU consumption on Compute Engine, Google Kubernetes Engine or the AI Hypercomputer is ordinary Google Cloud usage and would draw on the same credit pool, subject to the same year-one and year-two coverage percentages. Google promotes TPUs and GPUs to startups on its landing page but attaches no separate startup entitlement to them. (NOT SPECIFIED as a distinct benefit; covered only as general Google Cloud usage)

Are credits transferable? No. The programme terms state that incentives are not transferable and may not be sold, purchased or bartered. (OFFICIAL LIMITATION)

Can credits be converted into cash? No. The terms state that incentives are not redeemable for cash and are not refundable. (OFFICIAL LIMITATION)

Are credits reimbursements? No. Credits may only be used against qualifying service usage fees accrued after the time Google issues the credit. Spend incurred before issuance is not retroactively covered. This has a direct planning consequence: Antutive should avoid running significant paid Google Cloud workloads before credits are issued. (OFFICIAL LIMITATION)

Is an existing billing account required? Yes in practice. Google states that applicants should have their 18-character Google Cloud billing account ID ready, explains where to find it in the Cloud console under Billing, and provides a sign-up link for applicants who do not yet have one. Google also auto-populates the billing account ID from the Google Cloud account associated with the business email supplied. (OFFICIAL REQUIREMENT)

Do previous credits affect eligibility? Yes, and this is a hard gate. For the Scale tier and the AI programme, the company must not have received more than US\$5,000 in Google Cloud credits. For the Start tier, the company must not have received Google Cloud credits beyond the free trial. Separately, the terms state that a company may redeem only one incentive promotional code unless Google has previously approved otherwise in writing, and that if a company redeems incentives under these programmes Google reserves the right to refuse benefits under other Google Cloud promotional programmes. (OFFICIAL REQUIREMENT and OFFICIAL LIMITATION)

What happens when credits expire, and what happens to unused credits? Credits expire on the Credit Expiration Date. The programme agreement itself ends at the earlier of the date the company's qualifying usage fees exceed all issued credits, or the Credit Expiration Date. Google does not state that unused credits are extended, refunded, converted or carried forward, and Google states it is not required to notify the company when credits are exhausted. Unused credit value should therefore be assumed to be lost at expiry. (OFFICIAL CONDITION; extension or rollover is NOT SPECIFIED)

What happens after the credit period? The company is responsible for all service usage fees and charges not covered by, or in excess of, the credits. Standard Google Cloud list pricing applies to ongoing usage. There is no published grace period, glide path or automatic discount at the end of the programme. (OFFICIAL CONDITION)

Currency handling. All published amounts are stated in United States dollars. The terms state that credits issued are converted into the applicable local currency using market conversion rates published by leading financial institutions from time to time. Antutive should expect a foreign-exchange element if its billing currency is not USD. (OFFICIAL CONDITION)

Other financial and contractual obligations worth noting. The terms require the company not to use the services for cryptocurrency mining without Google's prior written consent. They allow Google to modify or update the programme terms and incentives at any time, and to revoke or terminate participation entirely. They oblige the company to keep non-public aspects of the programme confidential except to professional advisers under a duty of confidentiality or as required by law. They include the company's consent for Google to disclose information about the company's purchase and use of services to the company's then-current investors, and authorise Google to contact the company about the programme and with promotional material. Governing law is California for most regions, Singapore with arbitration for APAC billing addresses, and California law with arbitration for Latin American billing addresses. Antutive's founders should read these clauses before accepting, particularly the investor-disclosure consent and the confidentiality obligation. (OFFICIAL CONDITION)

8. Gemini, Agent Platform and AI Infrastructure Benefits

The table below lists every AI-related benefit or capability that Google mentions on the reviewed official pages, with an explicit status for each. Status values are: Included, meaning provided as part of the programme at no additional cost; Credit-funded, meaning available but paid for out of the credit allocation; Discounted; Conditional, meaning subject to a stated condition or separate application; and Not clearly specified.

| Benefit or capability | Status | Detail and source | | — | — | — | | Gemini models | Credit-funded | Programme credits cover Google's own state-of-the-art models, with Gemini named explicitly. Source: cloud.google.com/startup/ai, cloud.google.com/startup/early-stage | | Gemma models | Credit-funded | Named alongside Gemini as covered by programme credits. Source: cloud.google.com/startup/ai | | Third-party and non-Google models | Not covered by the regular allocation | Billed directly and excluded from the regular programme credit allocation. Source: cloud.google.com/startup/ai, cloud.google.com/startup/faq | | Partner models in Model Garden, up to US\$10,000 | Conditional, separate from the regular allocation | Qualifying Scale and Scale AI startups may receive an additional US\$10,000 in credits for partner models in Model Garden, with Anthropic, Mistral and AI21 named. Conditional and to be confirmed before it is relied on. Source: cloud.google.com/startup/perks | | Gemini API | Included at free tier, then credit-funded | A Gemini API key can be obtained without the startup programme; production usage is chargeable Google Cloud usage. Source: startup.google.com/gemini | | Google AI Studio | Included | Free-tier AI Studio access is listed as a Start tier benefit and AI Studio prototyping is promoted as available with no initial payment. Source: cloud.google.com/startup/pre-funded, startup.google.com/gemini | | Gemini Enterprise Agent Platform | Credit-funded | Named in the FAQ as an example of a service credits can be used for, and named on the AI programme page as the qualifying platform. Source: cloud.google.com/startup/faq, cloud.google.com/startup/ai | | Model Garden | Included as access, usage credit-funded | Google states programme participants can access Model Garden platforms for additional choice and flexibility. Source: cloud.google.com/startup/faq | | Model development, deployment and prompt development | Credit-funded | Not itemised individually; covered as Google Cloud usage on the agent platform. Source: cloud.google.com/startup/faq | | Fine-tuning | Credit-funded | Google publishes a fine-tuning guide for startups but attaches no separate entitlement. Source: cloud.google.com/startup/resources | | Embeddings and vector search | Not clearly specified | Neither is named as a distinct benefit on the reviewed pages; both would be ordinary Google Cloud usage | | GPUs | Not clearly specified as a distinct benefit | Promoted as available Google Cloud infrastructure with no separate startup entitlement; usage draws on credits. Source: cloud.google.com/startup | | TPUs | Not clearly specified as a distinct benefit | Google promotes its latest-generation TPU to startups; no separate startup entitlement stated. Source: cloud.google.com/startup | | AI Hypercomputer | Not clearly specified as a distinct benefit | Promoted to startups for AI and ML workloads; usage is ordinary Google Cloud usage | | Cloud Run | Credit-funded | Promoted to startups as a fast path from code to production; ordinary Google Cloud usage. Source: startup.google.com/cloud | | Firebase | Credit-funded | Google describes covered spend as Google Cloud and Firebase costs, so Firebase is explicitly within the credit scope. Source: startup.google.com/cloud, cloud.google.com/startup/perks | | Firebase Studio | Included | Listed as part of the Gemini Kit as a generative-AI full-stack environment. Source: [cloud.google.com/startup/gemini](https://startup.google.com/gemini) | | Cloud Storage, Cloud SQL and other managed databases | Credit-funded | Not itemised; ordinary Google Cloud usage within the credit scope | | BigQuery | Credit-funded | Named in the FAQ as an example of credit-eligible Google Cloud usage. Source: cloud.google.com/startup/faq | | Monitoring and observability | Credit-funded for Google Cloud services | Google Cloud observability is ordinary usage. Third-party observability tools appear as partner perks, not as credit-eligible spend | | Security services | Credit-funded for Google Cloud services | Google promotes its security solutions to startups; usage is ordinary Google Cloud usage. Source: cloud.google.com/startup | | Technical support | Included, conditional | US\$12,000 in Enhanced Support credits for one year at Scale tier. Source: cloud.google.com/startup/early-stage | | Technical architecture assistance | Included | Google Cloud engineers and expert advice for projects and challenges at Scale tier and in the AI programme. Source: cloud.google.com/startup/ai, startup.google.com/cloud | | AI experts | Included | Google Cloud expert availability and advice, plus webinars and live Q&As with AI product managers, engineers and developer advocates. Source: cloud.google.com/startup/ai | | AI product roadmap insight | Included | Stated as an AI programme benefit. Source: cloud.google.com/startup/ai | | Training | Included, capped | US\$500 in Google Skills credits at Scale tier and US\$200 at Start tier; generative AI training courses and Google Cloud Skills Boost also referenced. Source: cloud.google.com/startup/early-stage, cloud.google.com/startup/pre-funded, cloud.google.com/startup/faq | | Workshops and events | Included | Gemini API Sprints, AI Startup School, Google Cloud Next, technical webinars and VC AMA sessions. Source: cloud.google.com/startup/faq, cloud.google.com/startup/resources, startup.google.com/gemini | | Community | Included | Global community of startups, investors and partners; Gemini Startup Forum for selected seed to Series A founders. Source: cloud.google.com/startup/faq, cloud.google.com/startup | | Startup Success Manager | Included at Scale tier | Dedicated business support and success manager; a dedicated Startup Success Manager and Google Cloud engineers are named on the Google for Startups Cloud page. Source: cloud.google.com/startup/early-stage, startup.google.com/cloud | | Google Workspace Business Plus | Included, conditional | Twelve months free, conditional on the company domain not being subscribed to a paid Workspace plan from within 31 days of applying through to the day the benefit is requested, and not applicable to annual Business Plus plans. Source: cloud.google.com/startup/early-stage, cloud.google.com/startup/pre-funded | | Google Maps Platform credit | Conditional | US\$600 per month for one year at Scale tier, requiring a separate application. Source: cloud.google.com/startup/early-stage | | Partner perks including AI tooling | Included or discounted, conditional | A catalogue of partner offers across AI infrastructure and tooling, databases and analytics, and DevOps; a subset is exclusive to Scale tier members. These are third-party offers, not credit-eligible Google Cloud spend. Source: cloud.google.com/startup/perks | | Architecture reference material | Included | AI and ML architecture resources in the Google Cloud Architecture Center, technical guides and click-to-deploy solutions. Source: cloud.google.com/startup/faq, cloud.google.com/startup/resources | | ISV Startup Springboard | Conditional, separate programme | A twelve-week programme described as helping early-stage AI and cybersecurity independent software vendors become partners, with go-to-market and technical benefits. Separate application. Source: cloud.google.com/startup/resources, cloud.google.com/startup/early-stage | | AI Futures Fund | Separate programme | An equity-funding route for founders building next-generation AI products, distinct from cloud credits. Source: cloud.google.com/startup/resources |

Practical reading for Famant. Every service Famant is expected to use, with the exception of third-party tooling and of partner models beyond any separate partner-model credit that may be granted, falls into the credit-funded category rather than the included category. Gemini calls, agent-platform usage, Cloud Run containers, Cloud SQL instances, Cloud Storage buckets, Firebase usage, logging, monitoring and Google Cloud security services all consume credits at list price. The only genuinely free-standing benefits are support credits, Skills credits, Workspace, the Maps credit, expert access, training, events and partner perks. This distinction matters when building the cloud-spend forecast in section 22.

9. Complete AI Startup Eligibility Criteria

Criterion	Official status	Mandatory, conditional, recommended or unclear	Evidence that may be required	Official source
Company age, Scale tier and AI programme	Founded within the last five years	Mandatory	Incorporation date and certificate	cloud.google.com/startup/early-stage, cloud.google.com/startup/ai
Company age, Start tier	Founded within the last 24 months	Mandatory	Incorporation date and certificate	cloud.google.com/startup/pre-funded
Company age, conflicting statement	The Google for Startups Cloud page states founded within five years of applying, or ten years for Scale	Unclear, contradicts the Scale tier page	Not stated	startup.google.com/cloud
Incorporation status	Not stated as an explicit requirement in a dedicated bullet, but the programme is contracted with a company, the terms require legal authority to bind the company, and a founding date is required	Effectively mandatory	Certificate of incorporation, registration number	cloud.google.com/terms/startup-program-tos
Startup stage	Scale tier is for VC-funded startups ready to grow and scale; Start tier is for pre-funded startups with a working MVP	Mandatory as a routing criterion	Funding evidence, product evidence	cloud.google.com/startup/ai, cloud.google.com/startup/pre-funded
Funding stage window	Pre-seed or seed round within the last five years, or Series A round within the last twelve months	Mandatory for Scale and AI	Public evidence of the round and its date	cloud.google.com/startup/ai, cloud.google.com/startup/early-stage
Funding amount	No minimum or maximum amount is published	Unclear	Not stated	Not specified by Google on the reviewed pages
Equity funding type	Equity investment vehicles from institutional investors and venture capital firms; SAFEs eligible	Mandatory for Scale and AI	Public links to investment information	cloud.google.com/startup/early-stage
Non-qualifying funding for Scale	Private equity, government innovation grants, prize funding, crowdfunding, angel, friends and family	Mandatory exclusion for Scale; may be evaluated for other tiers	Disclosure of funding source	cloud.google.com/startup/early-stage, cloud.google.com/startup/faq
Investor requirements	Institutional investor or venture capital firm	Mandatory for Scale and AI	Investor name and public evidence	cloud.google.com/startup/early-stage
Stealth-mode companies	Must provide verification of funding; Google directs stealth applicants to work with their investor to verify funding and to contact startup support	Conditional	Investor confirmation	cloud.google.com/startup/early-stage, cloud.google.com/startup/faq
Accelerator requirements	No accelerator participation requirement is published for the Cloud Program	Not required	Not applicable	Not specified by Google on the reviewed pages
Product-based company status	Start tier is described as being for digital-native technology startups and excludes service agencies, consultancies and traditional small businesses; all tiers exclude dev shops, consultancies and agencies	Mandatory	Public website and product evidence	cloud.google.com/startup/pre-funded, cloud.google.com/startup/faq
AI-first product status	Inclusion in the AI programme requires being an AI-first startup, with AI in the	Mandatory for the AI uplift	Product description and AI use-case description	cloud.google.com/startup/faq

Criterion	Official status	Mandatory, conditional, recommended or unclear	Evidence that may be required	Official source
	company's foundational structure and strategy and not only as a productivity or bolt-on layer			
AI as a core differentiator	The application form describes an AI startup as one using AI as its core technology to develop its primary products or solutions	Mandatory for the AI uplift	Product description	cloud.google.com/startup/apply
Use of Google AI	The AI programme is for startups that use or plan to use the Gemini Enterprise Agent Platform or Gemini to deploy AI services as a foundation of their primary product or solution	Mandatory for the AI uplift; a stated plan is accepted, not only current usage	Architecture and usage plan	cloud.google.com/startup/ai
Geographic availability	No eligible-country list is published. Google may reject an application because of the geographic region or country of the company's primary place of business	Conditional and discretionary	Country declared in the application	cloud.google.com/terms/startup-program-tos
Existing Google Cloud account	Required in practice; the applicant needs a Google Cloud account and an 18-character billing account ID	Mandatory	Billing account ID	cloud.google.com/startup/faq, startup.google.com/cloud
Existing billing account	The 18-character billing account ID must be supplied and is auto-populated from the Google Cloud account linked to the business email	Mandatory	Billing account ID	cloud.google.com/startup/faq
Billing-account domain match	The company website domain must match the email domain and the email domain associated with the billing account in order to be approved for credits	Mandatory	Consistent domain across website, email and billing account	cloud.google.com/startup/faq
Previous Google Cloud credits, Scale and AI	Must not have received more than US\$5,000 in Google Cloud credits	Mandatory	Credit history disclosure	cloud.google.com/startup/early-stage, cloud.google.com/startup/ai
Previous Google Cloud credits, Start tier	Must not have received Google Cloud credits beyond the free trial	Mandatory	Credit history disclosure	cloud.google.com/startup/pre-funded
Previous programme participation	A company may redeem only one incentive promotional code unless Google approved otherwise in writing; previous participants are directed to contact their account manager or startup support	Conditional	Prior participation disclosure	cloud.google.com/terms/startup-program-tos, cloud.google.com/startup/faq
Other Google Cloud promotional programmes	If the company redeems incentives under this programme, Google may reject participation in other Google Cloud promotional programmes, and may stop issuing remaining incentives if the company participates in others	Conditional	Disclosure	cloud.google.com/terms/startup-program-tos
Company website	A publicly available company	Mandatory	Live public website	startup.google.com/

Criterion	Official status	Mandatory, conditional, recommended or unclear	Evidence that may be required	Official source
	website is listed as a basic requirement			cloud
Business-domain email	The business email used in the application must match the startup's public website domain; Google notes a matching business email can be created with Google Workspace	Mandatory	Company-domain email address	cloud.google.com/startup/faq, startup.google.com/cloud
Founder information	The form collects first name, last name, job role and job title of the applicant. No founder biography, profile or public-profile requirement is published	Partially mandatory as form fields; profiles not required	Applicant identity fields	cloud.google.com/startup/apply
Product information	No specific product-information field is published on step one of the form; the credit application step follows submission of the contact step	Unclear	Product description	Not fully specified by Google on the reviewed pages
Technical use case	Not published as a mandatory field on the pages reviewed	Unclear	AI use-case description	Not specified by Google on the reviewed pages
Industry and job role	Collected as mandatory fields on the application form	Mandatory	Selection from Google's lists	cloud.google.com/startup/apply
Business account requirement	The form instructs applicants to switch to their business account to apply for cloud credits	Mandatory	Signed in with the company-domain Google account	cloud.google.com/startup/apply
Terms acceptance	The company must have legal authority to accept the programme terms, and the effective date is the date the application is submitted	Mandatory	Authorised signatory submitting the application	cloud.google.com/terms/startup-program-tos
Agency, consultancy and dev-shop restriction	Google states it is unable to accept dev shops, consultancies or agencies	Mandatory exclusion	Positioning must not read as services	cloud.google.com/startup/faq
Service-company and traditional small business restriction	Start tier explicitly excludes service agencies, consultancies and traditional small businesses	Mandatory exclusion	Positioning	cloud.google.com/startup/pre-funded
Educational-institution restriction	Not accepted	Mandatory exclusion	Entity type	cloud.google.com/startup/faq
Government restriction	Government entities not accepted; the company must also ensure accepting incentives is not improper under any contract with a government or government-controlled entity	Mandatory exclusion and condition	Entity type and contract review	cloud.google.com/startup/faq, cloud.google.com/terms/startup-program-tos
Nonprofit restriction	Not accepted	Mandatory exclusion	Entity type	cloud.google.com/startup/faq
IPO or acquisition restriction	Companies that have listed publicly or been acquired are not accepted	Mandatory exclusion	Ownership status	cloud.google.com/startup/faq
Personal blogs or content	Not accepted	Mandatory exclusion	Business type	cloud.google.com/startup/faq
Cryptocurrency mining restriction	Cryptocurrency mining companies are not accepted,	Mandatory exclusion and condition	Declaration	cloud.google.com/startup/faq,

Criterion	Official status	Mandatory, conditional, recommended or unclear	Evidence that may be required	Official source
	and the services may not be used for cryptocurrency mining without Google's prior written consent			cloud.google.com/terms/startup-program-tos
Token distribution restriction	Companies distributing tokens contrary to regulatory guidance in their jurisdiction are not accepted	Mandatory exclusion	Declaration	cloud.google.com/startup/faq
Discretionary acceptance	Acceptance is at Google Cloud's discretion and AI applications are reviewed case by case	Overriding condition	Not applicable	cloud.google.com/startup/ai, cloud.google.com/startup/faq
Team size, revenue, user count, traction	No threshold is published on any reviewed page	Not required	Not applicable	Not specified by Google on the reviewed pages
Demo video, screenshots, pitch deck	Not published as requirements. Google states that for funding verification it wants links to publicly available online sources, and does not ask for a pitch deck to be sent	Not required; a pitch deck is explicitly not the preferred verification route	Public links instead	cloud.google.com/startup/faq
Specific technical stack beyond Google AI	No requirement beyond the Gemini or agent-platform foundation for the AI uplift	Not required	Not applicable	Not specified by Google on the reviewed pages

Documented inconsistency that must be resolved before applying. The Scale tier page and the AI programme page both state that the company must have been founded within the last five years. The Google for Startups Cloud overview page on startup.google.com states that the company must be founded within five years of applying, or ten years for Scale. These statements cannot both be right, and this report does not independently determine which one governs. Antutive should treat five years as the safer eligibility assumption, and should confirm the position directly with Google Startup Support if Antutive is older than five years. The five-year figure is the more conservative basis on which to plan because it appears on the two pages that define the Scale tier and the AI programme, but the ten-year statement on startup.google.com has not been withdrawn and only Google can resolve the conflict.

10. Application Process
Google publishes a two-step application flow. Step one is a contact and company form at cloud.google.com/startup/apply. Google states that this is the first step in applying and that cloud credits are applied for in the next step. The content of step two was not completed or submitted during this analysis, so the exact fields of the credit-application step are not documented here. (NOT SPECIFIED)
Step 1 — Verify eligibility before touching the form. Confirm the tier that matches the company's funding position, confirm company age, confirm that prior Google Cloud credits are within the stated limit, and confirm that the company is not in an excluded category. Applying to the wrong tier wastes the single application and starts the programme agreement, because the terms state the agreement becomes effective on the date the application is submitted.
Step 2 — Prepare the Google account. Google instructs applicants to switch to their business account to apply for cloud credits. Sign in with the company-domain Google account, not a personal account. (OFFICIAL REQUIREMENT)
Step 3 — Prepare the company-domain email. The business email in the application must match the public website domain. Google notes that a matching business email can be created with Google Workspace if one does not exist. (OFFICIAL REQUIREMENT)
Step 4 — Prepare and align the billing account. Create a Google Cloud account if none exists, then retrieve the 18-character billing account ID from the Cloud console under Billing and Manage your billing account. Google auto-populates this ID from the Google Cloud account associated with the business email supplied, and allows the applicant to correct it manually or by supplying the correct associated email. Critically, Google states that in order to be approved for credits the company website domain must match the email domain and the email domain associated with the billing account. Align all three before applying. (OFFICIAL REQUIREMENT)
Step 5 — Prepare company information. Step one of the form collects company name, industry, country, business phone with country code, job role and job title, in addition to the applicant's name and business email. Have the exact legal company name and the correct country of primary business ready. (OFFICIAL REQUIREMENT)
Step 6 — Prepare founder information. The form collects the applicant's name, role and title. No founder biography or public profile is required by Google. Preparing verifiable founder profiles is a recommendation, not a requirement. (RECOMMENDATION)

Step 7 — Prepare funding information and its verification. For Scale tier and AI programme applications, assemble links to publicly available online sources that document the equity investment in the company. Google explicitly asks for public links rather than pitch decks and funding documents. If the company is in stealth, Google directs the applicant to work with the investor to verify funding and to contact startup support. (OFFICIAL REQUIREMENT and OFFICIAL CONDITION)
Step 8 — Prepare investor or accelerator information. Have the institutional investor or venture capital firm name and the round type and date available. Accelerator participation is not a published requirement of the Cloud Program. (OFFICIAL REQUIREMENT for investor detail at Scale; accelerator detail is RECOMMENDATION only)
Step 9 — Declare the startup type. On the form, select the AI startups option if AI is the core technology behind the primary product. Google offers AI startups, Web3 startups, or none of these. Selecting AI is what routes the application toward the AI uplift. (OFFICIAL REQUIREMENT to declare)
Step 10 — Prepare the product and AI use-case description. Although step one does not collect a product description, an AI-first assessment cannot be made without one, and Google states AI applications are reviewed case by case. Prepare a concise, factual description of Famant, the customer problem, and precisely which Gemini and agent-platform capabilities the product depends on. (RECOMMENDATION, because the exact field is NOT SPECIFIED)
Step 11 — Prepare the technical architecture and cloud-spend estimate. Not published as required fields. Prepare them anyway; they are the substance of any follow-up conversation with a Startup Success Manager or Google Cloud engineer, and they are needed for the company's own planning. (RECOMMENDATION)
Step 12 — Disclose existing credits. Be accurate about any Google Cloud credits already received. The terms void incentives where Google determines there is abuse or fraud, expressly including providing false information in connection with the account, and permit Google to invoice the company at list price as though the incentives never applied. (OFFICIAL CONDITION)
Step 13 — Submit. Submission of the application is the effective date of the Google Cloud Startups Program Startup Terms. The person submitting must have full legal authority to bind the company. Do not submit unless that is true. (OFFICIAL CONDITION)
Step 14 — Review and decision timeline. Google states that in most cases applicants can expect to be informed within a few business days of submission, and that applications requiring further manual review may take ten days or more. (OFFICIAL CONDITION)
Step 15 — Follow-up requests. Google's terms permit it to reasonably request information about the company's business as it relates to the programme. Expect possible follow-up on funding verification, domain matching or AI-first positioning. (OFFICIAL CONDITION)
Step 16 — Acceptance and credit activation. Participation requires Google's written acceptance, with email permitted. Google states that details of additional AI, Google Workspace and Google Maps Platform benefits are provided in the programme welcome email. Credits may be issued in increments at Google's discretion and carry an expiry date shown in the console or communicated in writing. (OFFICIAL CONDITION)
Step 17 — Onboarding. At Scale tier, onboarding includes a dedicated business support contact and success manager, access to Google Cloud engineers, Enhanced Support credits, Skills credits and the perks catalogue. The Maps Platform benefit requires a separate application and the Workspace benefit must be requested while the domain condition is still satisfied. Act on the time-bound benefits early. (OFFICIAL BENEFIT and OFFICIAL CONDITION)
Step 18 — Reapplication. Google does not publish a reapplication policy, a cooling-off period or an appeals process. For both rejection and prior participation with unused credits, Google directs the company to email its account manager or the startup support address cloudstartupsupport@google.com. (OFFICIAL CONDITION; the substantive policy is NOT SPECIFIED)
Contact and support. The published contact route for programme questions, rejections, stealth-mode handling and prior participation is cloudstartupsupport@google.com, or the company's Google Cloud account manager if one exists. (OFFICIAL)

11. What Google Officially Evaluates

11.1 Officially stated evaluation factors

These are the only factors the reviewed official pages state as eligibility or selection criteria. Everything Google publishes about assessment is eligibility filtering plus a general statement of discretion. Google does not publish a scoring model, a rubric, weightings, or any description of how a qualifying application is ranked against others.

1. Funding type, source and recency: institutional or venture capital equity funding, with pre-seed or seed inside five years or Series A inside twelve months, and SAFEs accepted. Named non-qualifying sources are excluded from Scale.
2. Company age: founded within the last five years for Scale and the AI programme, and within the last 24 months for the Start tier.
3. Prior Google Cloud credit history: not more than US\$5,000 for Scale and the AI programme, and nothing beyond the free trial for the Start tier.
4. AI-first status, for the AI uplift: AI must be foundational to the company's structure and strategy and not a bolt-on productivity layer, and the product must be built, or planned to be built, on Gemini or the Gemini Enterprise Agent Platform.
5. Business type: dev shops, consultancies, agencies, educational institutions, government entities, nonprofits, personal blogs or content, cryptocurrency mining companies, companies distributing tokens contrary to regulatory guidance, and companies that have listed publicly or been acquired are not accepted. The Start tier additionally excludes service agencies and traditional small businesses.
6. Start tier product and business criteria: a working MVP, a clear business model and an intention to seek venture funding soon.
7. Identity and domain consistency: a publicly available company website, a business email on that domain, and a billing account whose associated email domain matches.

8. Billing readiness: a Google Cloud account and an 18-character billing account ID.
9. Verifiability of funding: publicly available online sources, or investor verification for stealth companies.
10. Geographic region or country of the primary place of business, as a discretionary ground on which Google may reject an application.
11. Google Cloud's overall discretion, with AI applications reviewed on a case-by-case basis.

Explicit statement of the limits of public information. Google does not explain how applications are evaluated beyond the eligibility criteria and its statement of discretion. Any claim about internal scoring, reviewer preferences, approval rates, or what makes one qualifying application succeed over another is not supported by the reviewed official pages.

11.2 Recommended preparation areas

The following are recommendations from this analysis. They are not Google requirements and they are not undisclosed Google scoring criteria. They are the areas an AI startup should be able to demonstrate because they are the natural subject of eligibility filtering and any follow-up contact.

Area	Why it is worth preparing	Status
Verifiable company identity	Google requires a public website, a matching email domain and a matching billing domain; a reviewer must be able to confirm the company exists	RECOMMENDATION supporting an OFFICIAL REQUIREMENT
AI-first product evidence	The AI uplift turns on a judgement about whether AI is foundational; the website and product description are the only material a reviewer has	RECOMMENDATION supporting an OFFICIAL REQUIREMENT
Product-based business positioning	Consultancies, agencies and dev shops are excluded; ambiguous positioning invites the wrong classification	RECOMMENDATION supporting an OFFICIAL LIMITATION
Technical feasibility	A coherent architecture makes the Gemini-foundation claim credible	RECOMMENDATION
Appropriate startup stage	Applying to the tier that matches the funding reality avoids a wasted application	RECOMMENDATION
Funding eligibility documentation	Public links are what Google asks for; assemble them in advance	RECOMMENDATION supporting an OFFICIAL REQUIREMENT
Scalable Google Cloud usage plan	Needed for the company's own credit management and for onboarding conversations	RECOMMENDATION
Business model	Explicitly required at Start tier and generally useful	OFFICIAL REQUIREMENT at Start tier, otherwise RECOMMENDATION
Product evidence such as screenshots or a demo	Not required by Google, but it is the fastest way for a reviewer to see that the product is real and AI-centred	RECOMMENDATION
Founder credibility	Not required by Google; supports verifiability	RECOMMENDATION
Team capability	Not required by Google	RECOMMENDATION
Technical roadmap	Not required by Google; useful for milestone planning during the credit period	RECOMMENDATION
Cloud-spend plan	Not required by Google; essential for avoiding credit exhaustion and post-credit shock	RECOMMENDATION
Responsible AI practices	Not required by Google as an eligibility criterion, though Google promotes responsible AI to startups; valuable for a family and child-adjacent product like Famant	RECOMMENDATION

12. Antuitive Website Readiness

12.1 Official website-related requirements

Only three website-related points are stated by Google on the reviewed pages, and all three are hard.

1. The company must have a publicly available company website. (OFFICIAL REQUIREMENT, startup.google.com/cloud)
2. The company must use a company email domain that matches the company website. (OFFICIAL REQUIREMENT, startup.google.com/cloud and cloud.google.com/startup/faq)
3. To be approved for credits, the company website domain must match the email domain and the email domain associated with the Google Cloud billing account. (OFFICIAL REQUIREMENT, cloud.google.com/startup/faq)

Google does not require any specific page, section, layout, content element, screenshot, demo, legal page or team page on the website. Everything in section 12.2 is therefore a recommendation. (NOT SPECIFIED)

12.2 Essential public website items before applying

The table in section 12.3 is deliberately exhaustive, and it should not be read as a build list that must be completed before an application is submitted. Google does not require any of those pages. For practical execution, the items below are the ones that genuinely matter before applying, because each either satisfies a stated Google requirement or directly protects against the classification and integrity risks described in section 19.

#	Essential item	Why it is essential
1	A live Antutive website	OFFICIAL REQUIREMENT. A publicly available company website is stated on startup.google.com/cloud
2	Website, business email and billing account on the same company domain	OFFICIAL REQUIREMENT. Google states the domains must match for credits to be approved
3	Clear AI-product-company positioning	The AI-first judgement is made case by case from public material
4	A clear Famant product explanation	The product is the evidence of AI-first status
5	Accurate product status	Prevents an over-claim being discovered and protects against the misleading-information condition
6	Company and contact information	Identity verification and a route for Google follow-up
7	Working Privacy Policy and Terms	Likely a legal obligation independently of Google, and a basic credibility signal
8	No agency, consultancy or dev-shop positioning	Those business types are expressly excluded from the programme
9	No false funding, user, partnership or product claims	Providing false information can void incentives under the programme terms

Everything else in section 12.3, and the fuller site map in section 13, can be added afterwards in priority order. Pages such as Responsible AI, Google Cloud Architecture, Roadmap, Careers, Blog, Security and a dedicated AI and Technology page are useful and are recommended, but they are not Google application requirements and should not delay a submission that is otherwise ready.

12.3 Additional recommended website improvements

The reason these recommendations matter is indirect but real. Google excludes agencies, consultancies, dev shops, personal content sites and traditional small businesses, and it makes a case-by-case judgement about whether AI is foundational. The public website is the primary artefact through which a reviewer forms that judgement. A website that reads as a services business, or that does not make the AI dependency obvious, creates avoidable classification risk.

Item	Why it matters	Status	Content to add	Priority
Clear company name	Must match the legal entity name used in the application	RECOMMENDATION supporting identity verification	Antutive stated consistently in the header, footer and About page	Critical
Clear AI-company positioning	The AI-first judgement is made from public material	RECOMMENDATION	A one-line statement that Antutive is an AI-first product company building AI-native software	Critical

Item	Why it matters	Status	Content to add	Priority
Description of what Antutive builds	Distinguishes a product company from a services company	RECOMMENDATION supporting the agency and dev-shop exclusion	A short paragraph describing Antutive as a product company whose products are AI-native	Critical
Description of Famant	The product is the evidence of AI-first status	RECOMMENDATION	Famant described as an AI-powered family-management and household-coordination platform	Critical
Clear customer problem	Makes the product credible rather than generic	RECOMMENDATION	The coordination burden carried by households: scattered schedules, tasks, documents and expenses	High
Clear product solution	Connects the problem to the AI capability	RECOMMENDATION	How Famant's assistant consolidates and acts on family context	High
AI-first value proposition	Directly addresses the bolt-on concern	Critical to the AI uplift assessment; RECOMMENDATION as to method	An explicit statement that the assistant, scheduling intelligence and document understanding are the product, not add-ons	Critical
Product-development status	Prevents misleading claims and prevents an over-claim being discovered	RECOMMENDATION, and an integrity requirement	Honest labels such as In development, In private testing or Planned against each capability	Critical
AI capabilities list	Lets a reviewer see the depth of AI dependency	RECOMMENDATION	Assistant, voice actions, AI task creation and delegation, family-aware scheduling, conflict detection, document understanding, OCR, expense intelligence, AI reminders, AI-curated dashboard, each with a status label	High
Intended Gemini usage	Google's AI programme names Gemini specifically	RECOMMENDATION supporting an OFFICIAL REQUIREMENT	A technology page stating that Famant is being built on Gemini models, with the intended role of each	High
Intended agent-platform usage	Google names the Gemini Enterprise Agent Platform as the qualifying platform	RECOMMENDATION supporting an OFFICIAL REQUIREMENT	Stated intent to use the Gemini Enterprise Agent Platform for agent orchestration, evaluation and deployment, using the exact current Google product names that match the planned architecture. Vertex AI remains an active Google Cloud product and should not be described as legacy	High
Intended Google Cloud usage	Demonstrates a real architecture rather than an idea	RECOMMENDATION	Cloud Run, Cloud SQL, Cloud Storage, Firebase, monitoring and security named with their role	Medium
Product screenshots	Fastest possible proof that the product exists	RECOMMENDATION	Real interface images only, never mock-ups presented as product	High
Demo video	Shows the AI behaviour rather than describing it	RECOMMENDATION	A short recorded walkthrough of a real assistant interaction	High
Waitlist or beta call to action	Shows commercial intent and generates verifiable interest	RECOMMENDATION	A working waitlist form with confirmation	Medium
Founder profiles	Supports verifiability of the people behind the company	RECOMMENDATION	Names, roles and short factual biographies	High
Team profiles	Supports credibility	RECOMMENDATION	Only real team members; do not list intended hires as staff	Medium
LinkedIn profiles	External corroboration of identity	RECOMMENDATION	Links from founder and team entries	Medium

Item	Why it matters	Status	Content to add	Priority
Company-domain email	Required for the application to be approved	OFFICIAL REQUIREMENT	A working mailbox on the Antutive domain, used in the application and linked to the billing account	Critical
Contact information	Basic trust signal and a route for Google follow-up	RECOMMENDATION	Company-domain contact address and, where lawful, a registered address	High
About page	Where identity, mission and positioning are confirmed	RECOMMENDATION	Legal name, founding context, mission, product-company framing	High
Product page	Where the AI-first case is actually made	RECOMMENDATION	Full Famant page as specified in section 14	Critical
AI and Technology page	Concentrates the Gemini and agent-platform evidence in one place	RECOMMENDATION	Model usage, architecture overview, evaluation approach	High
Responsible AI page	Highly relevant for a family product handling household and possibly children's data	RECOMMENDATION	Safety approach, human-in-the-loop design, limits of the assistant, escalation and correction paths	High
Security page	Trust signal for a product holding family documents	RECOMMENDATION	Encryption in transit and at rest, access control, tenancy separation, incident response. Claim only what is implemented	High
Privacy page and Privacy Policy	Legal necessity in most jurisdictions for a product processing personal data	RECOMMENDATION, and likely a legal obligation independent of Google	Lawful basis, data categories, retention, processors including Google Cloud, subject rights, contact for privacy requests	Critical
Terms and Conditions	Legal necessity once a waitlist or beta exists	RECOMMENDATION, and likely a legal obligation	Service terms, acceptable use, liability, termination	Critical
Cookie Policy and consent	Required in many jurisdictions where analytics or tracking is used	RECOMMENDATION, and likely a legal obligation	Cookie categories, purposes and a consent mechanism	High
AI data-processing transparency	Families will ask what the model sees; reviewers will notice its absence	RECOMMENDATION	What data is sent to models, whether it trains models, retention, and how documents and voice data are handled	High
Product roadmap	Shows direction without over-claiming	RECOMMENDATION	Themed roadmap with statuses, no committed dates unless certain	Medium
Company updates	Signals an active company	RECOMMENDATION	Short dated updates	Medium
Blog	Demonstrates technical depth and AI seriousness	RECOMMENDATION	Two to four substantive posts on the AI architecture and family-safety design	Medium
Careers page	Signals a growing product company	RECOMMENDATION	Only real openings, or a general expression-of-interest route	Optional
Registration details	Corroborates the legal entity	RECOMMENDATION, subject to local disclosure rules	Legal name, registration number and jurisdiction in the footer or a legal page, where lawful and confirmed	Medium
Investor information	Only if confirmed	RECOMMENDATION, conditional	Publish investor names only where the investment is real and the investor consents. Google verifies funding through public sources, so accuracy matters	Conditional
Accelerator information	Only if confirmed	RECOMMENDATION, conditional	Publish only confirmed participation	Conditional

Item	Why it matters	Status	Content to add	Priority
Consistent branding	Basic professionalism and identity consistency	RECOMMENDATION	One name, one logo, one description used everywhere	Medium
Mobile responsiveness	Reviewers and users will open the site on phones; Famant is a household product	RECOMMENDATION	Test all pages at mobile widths	High
Working links	Broken links undermine credibility	RECOMMENDATION	Full link audit before applying	High
No placeholder content	Placeholder text signals an unfinished company	RECOMMENDATION	Remove all sample text, dummy images and empty pages	Critical
No misleading claims	Providing false information can void incentives under the programme terms	Supports an OFFICIAL CONDITION	Remove any claim of users, revenue, funding, partnerships, awards or completion that is not confirmed	Critical

13. Recommended Antutive Website Structure

Everything in this section is a RECOMMENDATION. Google does not mandate any website structure, and this is a target state rather than a pre-application requirement. Only the essential items listed in section 12.2 need to exist before applying; the remaining pages below can be built out afterwards in priority order.

| Page | Purpose | Required content | Trust signals | Calls to action | Must not be falsely claimed | | — | — | — | — | — | — | | Home | Establish in one screen that Antutive is an AI-first product company and Famant is its AI-native product | Positioning line, problem statement, three to five AI capabilities with status labels, product visual, link to Famant | Real product imagery, founder visibility, working legal links | Join the Famant waitlist; See how Famant works | User numbers, funding, awards, launch dates, enterprise customers | | About Antutive | Confirm the legal identity and the product-company nature | Legal company name, jurisdiction and founding year if confirmed, mission, why an AI-first approach, product-company statement | Registration details where lawful, company-domain contact | Contact us; Read about our technology | Team size, offices, revenue, history that did not happen | | Products | Show a coherent product portfolio, even if it contains one product | Portfolio overview with Famant as the flagship and honest status labels | Consistent naming | Explore Famant | Additional products that do not exist | | Famant | Carry the AI-first case in detail | Full structure per section 14 | Screenshots, demo, security and privacy links, honest status | Join the waitlist; Watch the demo | Feature completeness, integrations, pricing that is not decided | | AI and Technology | Concentrate the Gemini and agent-platform evidence | Which Gemini models are used and for what, agent orchestration approach, retrieval and document-understanding approach, evaluation and quality approach, guardrails | Named Google services, architecture diagram, evaluation description | Read our Responsible AI approach | Fine-tuned proprietary models, benchmark results or accuracy figures that have not been measured | | Google Cloud Architecture | Show the deployment is real and scalable | Cloud Run services, Cloud SQL, Cloud Storage, Firebase, Gemini and agent-platform integration, monitoring, security, environments, data region | Diagram, environment table | Contact us for technical detail | Production deployment, uptime figures, certifications not held | | Responsible AI | Address safety for a household product | Design principles, human confirmation before consequential actions, minors and household-member considerations, error handling and correction, escalation, model limitations | Plain-language commitments, review cadence | Read our privacy approach | Certifications, external audits or endorsements that do not exist | | Security and Privacy | Reassure families and reviewers | Encryption in transit and at rest, access control, workspace and tenant separation, backup, logging, incident response, subprocessors, data residency | Named controls, contact for security reports | Contact security | ISO, SOC 2, HIPAA or similar compliance claims not actually held | | Team | Make the people verifiable | Founder and team names, roles, short factual biographies, LinkedIn links | Real photographs, external profiles | Careers; Contact | Advisers, investors or employees who have not agreed | | Roadmap or Updates | Show momentum honestly | Themed roadmap with statuses of Planned, Under development, In private testing, Released; dated updates | Regular cadence | Subscribe to updates | Committed release dates that are not certain | | Blog | Demonstrate AI depth | Technical posts on the assistant architecture, scheduling-conflict reasoning, document understanding and family-safety design | Author attribution, dates | Subscribe | Case studies or results without real data | | Careers | Signal a growing product company | Real openings or an expression-of-interest form | Honest hiring stage | Express interest | Team size or funding implied by fake roles | | Contact | Provide a route for Google and for users | Company-domain email, contact form, response expectation, registered address where lawful | Working form with confirmation | Contact us | Support hours or SLAs not operated | | Legal pages | Meet legal obligations and support the credit approval path | Privacy Policy, Terms and Conditions, Cookie Policy, Acceptable Use, DPA or subprocessor list if applicable | Version dates, effective dates | None | Compliance frameworks not implemented |

14. Recommended Famant Product Page

Everything in this section is a RECOMMENDATION. Each capability listed in the supplied company context is treated as unconfirmed and must carry an honest status label. Suggested labels: Planned, Under development, In private testing, To be verified, Not yet confirmed.

1. Product description. Famant is an AI-powered family-management and household-coordination platform being built by Antutive. One paragraph, no jargon, and an explicit statement that AI is the mechanism rather than a feature.

2. Target users. Households coordinating multiple people, schedules and responsibilities. Name the household roles the product is designed for without claiming an existing user base.

3. The household problem. Family coordination is fragmented across calendars, messages, paper documents, shared lists and separate financial tracking, so the coordination load falls on one or two people and things are missed. This is the section that justifies an AI approach: the work is contextual judgement, not data entry.

4. The product solution. A single family-aware layer where an assistant reads context, proposes actions, and executes on confirmation.

5. Core modules, each with a status label.

Module	What to present	Suggested status label
AI family assistant	Natural-language requests across calendar, tasks, lists, documents and expenses; the central pillar of the AI-first claim	To be verified
Voice actions	Spoken requests converted to structured actions with confirmation	To be verified
AI-powered scheduling	Proposing times using family context such as routines, travel time and dependants	To be verified
Scheduling-conflict detection	Detecting and explaining overlaps and impossible sequences, with proposed resolutions	To be verified
AI task creation and delegation	Turning requests and documents into tasks and suggesting the appropriate family member	To be verified
Document intelligence	Understanding uploaded documents and producing structured, searchable information	To be verified
OCR for receipts and invitations	Extracting amounts, dates, venues and participants from images and PDFs	To be verified
Automated actions from documents	Creating events, reminders or expenses from an uploaded document, on confirmation	To be verified
Expense and budgeting intelligence	Categorising household spend and surfacing patterns; describe as insight, never as financial advice	To be verified
Shared lists	Collaborative household lists with assistant-generated items	To be verified
Shared family workspace	The shared context all members see	To be verified
Personal workspace	Private space separated from shared family content	To be verified
Real-time collaboration	Live updates across members and devices	To be verified
AI-generated reminders	Context-aware reminders rather than fixed alarms	To be verified
AI-curated family dashboard	A prioritised daily view assembled by the assistant	To be verified
AI recommendations from family context	Suggestions grounded in the household's own data	To be verified

6. Security. How family data is protected, what separates personal from shared workspaces, and how access is controlled. Claim only implemented controls.

7. Privacy. What data the product holds, what is sent to AI models, whether that data is used to train models, retention periods, and how a family can export or delete its data. For a product that may hold information about children, this section deserves unusual care and should be reviewed by a qualified privacy adviser.

8. Screenshots. Real interface captures only. If the interface is incomplete, show fewer real screens rather than mock-ups. Label any illustrative image as a design concept.

9. Demo video. A short walkthrough of one genuine end-to-end flow, for example uploading an invitation and confirming the resulting calendar event and reminder. One real flow is stronger evidence of AI-first status than a long list of claims.

10. Beta or waitlist status. State the actual stage plainly. If a beta is not open, say that access is not yet open and offer a waitlist. Do not publish user or waitlist counts unless they are accurate.

11. Pricing. Only if confirmed. Otherwise state that pricing is not yet announced. Do not publish placeholder tiers.

12. Roadmap. Themes and statuses, not dates, unless a date is certain.

13. Calls to action. Join the waitlist as the primary action; watch the demo and read the technology page as secondary actions.

How to present Famant as AI-native without exaggeration. Lead with the mechanism, not adjectives. Describe one concrete AI behaviour end to end, name the Google model and platform performing it, state the current status honestly, and describe what happens when the AI is wrong. A page that says the assistant proposes a resolution to a detected conflict and asks a parent to confirm, and that this capability is under development on Gemini, is more convincing to a technical reviewer than a page claiming a finished autonomous family AI. Honest status labels also protect Antutive contractually, because the programme terms allow Google to void incentives where false information has been provided.

15. Application Evidence Checklist

Status values: **CR** Confirmed requirement stated by Google; **CO** Conditional requirement; **RP** Recommended preparation; **NC** Not confirmed by Google as a requirement.

#	Evidence item	Status	Notes
1	Certificate of incorporation	RP	Not requested on the reviewed pages, but company age is a stated criterion and must be evidenced if queried
2	Company registration information	RP	Supports identity verification
3	Incorporation date	CR	Company age limits are explicit: five years for Scale and the AI programme, 24 months for Start
4	Registered country	CR	Country is a form field and geography is a discretionary ground for rejection
5	Company-domain email	CR	Must match the public website domain
6	Official public website	CR	A publicly available company website is a stated basic requirement
7	Website domain matching the billing account email domain	CR	Explicitly required for credit approval
8	18-character Google Cloud billing account ID	CR	Stated prerequisite before applying
9	Google Cloud account signed in as a business account	CR	The form instructs applicants to switch to their business account
10	Applicant name, job role and job title	CR	Mandatory form fields
11	Legal authority to accept the programme terms	CR	Required by the programme agreement
12	Company name, industry and	CR	Mandatory form fields

#	Evidence item	Status	Notes
	business phone		
13	Startup type declaration as an AI startup	CR	Required to route toward the AI uplift
14	Founder names	RP	Only the applicant's identity is collected
15	Founder LinkedIn profiles	NC	Not requested by Google
16	Team details	NC	Not requested by Google
17	Product description	RP	Not a stated step-one field, but essential to an AI-first assessment
18	AI use-case description	RP	Essential in substance; the exact field is not published
19	Evidence that AI is foundational rather than bolt-on	CR in substance	Google states this is the AI programme requirement, assessed case by case
20	Gemini usage or usage plan	CR	The AI programme accepts current use or a stated plan to use Gemini or the agent platform
21	Gemini Enterprise Agent Platform usage plan	CR	Named as the qualifying platform
22	Technical architecture	RP	Not requested; needed for follow-up and planning
23	Google Cloud service plan	RP	Not requested; needed for credit management
24	Product-development status	RP for Scale, CR for Start	A working MVP is an explicit Start tier criterion
25	Product screenshots	NC	Not requested; strong supporting evidence
26	Product demo	NC	Not requested; strong supporting evidence
27	Beta users	NC	No threshold published
28	Waitlist count	NC	Not requested
29	User traction	NC	No threshold published
30	Revenue	NC	No threshold published
31	Funding information	CR for Scale and AI	Type, source, round and date must qualify
32	Public links evidencing the equity investment	CR for Scale and AI	Google asks for publicly available online sources
33	Investor details	CR for Scale and AI	Must be an institutional investor or venture capital firm
34	Investor verification for stealth companies	CO	Google directs stealth applicants to have the investor verify funding
35	Accelerator details	NC	Not a Cloud Program requirement
36	Pitch deck	NC	Google explicitly prefers public links over decks and funding documents
37	Business model	CR for Start tier, RP otherwise	A clear business model is an explicit Start tier criterion
38	Target market	RP	Not requested
39	Cloud-spend estimate	RP	Not requested; essential for credit strategy
40	Disclosure of previous Google Cloud	CR	Hard caps apply and false

#	Evidence item	Status	Notes
	credits		information can void incentives
41	Disclosure of participation in other Google Cloud promotional programmes	CO	Google may withhold or stop incentives where other programmes are used
42	Confirmation that the company is not in an excluded category	CR	Excluded categories are explicit
43	Privacy Policy	NC by Google, but likely a legal obligation	Necessary for a product processing family data
44	Terms and Conditions	NC by Google, but likely a legal obligation	Necessary once a waitlist or beta exists
45	Security documentation	NC	Recommended for a product holding household documents
46	Responsible AI explanation	NC	Recommended, particularly for a family product
47	AI data-processing explanation	NC by Google, but likely a legal obligation	Required in many jurisdictions where personal data is sent to AI models
48	Confirmation that services will not be used for cryptocurrency mining	CO	A programme term, not an application field
49	Confirmation that accepting incentives is not improper under any government contract	CO	A programme term
50	Acknowledgement of the confidentiality and investor-disclosure clauses	CO	Programme terms that bind the company on acceptance

16. Antutive and Famant Readiness Assessment

This assessment uses only the supplied company context and the official Google criteria. Where the context does not confirm a fact, the status is Needs verification or Missing. Nothing has been inferred or invented.

| Dimension | Status | Basis and what is missing | | — | — | — | | AI-first positioning | Partially aligned | Antutive is described as intended to be an AI-first product company and Famant's described capabilities are AI-centred. The intent is right; there is no confirmation that public material states this, and Google judges AI-first status case by case from available evidence | | Product definition | Partially aligned | Famant is clearly defined in concept with a coherent capability set. No capability is confirmed as built | | Website maturity | Needs verification | No information was supplied about whether a public Antutive website exists. A publicly available company website is a stated Google requirement, so this is a potential hard blocker | | Team credibility | Needs verification | No founder or team information was supplied | | Company registration | Needs verification | Incorporation status, legal name, jurisdiction and date are all unconfirmed. Company age is a hard criterion | | Funding status | Needs verification | No funding is confirmed. This single item determines whether the AI programme and its US\$350,000 maximum are accessible at all | | Investor status | Needs verification | No investor is confirmed. Scale tier requires an institutional investor or venture capital firm | | Accelerator status | Not yet applicable | Not a Cloud Program requirement and not confirmed | | Google Cloud architecture | Partially aligned | An intended service set is described, covering Gemini, agent platform, Cloud Run, Cloud Storage, Cloud SQL, Firebase, databases, monitoring, security and analytics. It is an intention, not a documented architecture, and no environment or region design is confirmed | | Gemini usage | Partially aligned | Intended usage is stated. Google accepts a plan to use Gemini, so intent can satisfy the criterion, but the plan must be articulated concretely | | Agent platform usage | Partially aligned | The supplied context refers to Vertex AI. On the pages reviewed on 28 July 2026 Google presents this capability as the Gemini Enterprise Agent Platform, so Antutive should update its terminology before applying | | Product demo | Missing | No demo is confirmed. Not a Google requirement, but the strongest available evidence of AI-first status | | Beta users | Needs verification | Not confirmed. No Google threshold exists | | Traction | Needs verification | Not confirmed. No Google threshold exists | | Revenue | Needs verification | Not confirmed. No Google threshold exists | | Legal pages | Needs verification | Privacy Policy, Terms and Conditions and cookie handling are unconfirmed. Likely legal obligations independent of Google | | Security | Needs verification | No implemented control is confirmed. Material for a product holding family documents | | Privacy | Needs verification | Data handling, retention and model-data flows are unconfirmed. Elevated importance because households may include children | | Responsible AI | Missing | No responsible-AI position is confirmed. Recommended rather than required | | Technical documentation | Missing | No architecture document, data-flow diagram or environment plan is confirmed | | Business model | Needs verification | No monetisation model is confirmed. An explicit Start tier criterion | | Cloud-spend forecast | Missing | No forecast exists. Needed to manage credits responsibly and to plan for post-credit costs | | Application evidence pack | Missing | None of the items in section 15 is confirmed as assembled | | Billing account and 18-character ID | Needs verification | Not confirmed. A stated prerequisite | | Company-domain email aligned to website and billing account | Needs verification | Not confirmed. Explicitly required for credit approval | | Prior Google Cloud credits | Needs verification | Not confirmed. A hard cap applies at both tiers | | Country of primary business | Needs verification | Not supplied. Geography is a discretionary ground for rejection |

Summary of the readiness position. Antutive's product concept is the strongest part of its application case and is genuinely well matched to

what Google describes as an AI-first startup. Everything else that Google actually gates on is unverified: incorporation, funding, domain and billing alignment, and the existence of a public website. The honest conclusion is that Antutive is not currently in a position to submit a Scale tier or AI programme application, and cannot yet confirm eligibility for the Start tier either.

17. Gap Analysis

Area	Current known status	Official requirement or recommendation	Gap	Required action	Suggested owner	Priority	Evidence required	Completion status
Legal incorporation	Unconfirmed	Company age limits are official; a company must exist to contract	Cannot confirm eligibility for either tier	Confirm or complete incorporation and record the exact legal name, jurisdiction and date	Founder or CEO	Critical	Certificate of incorporation	Not started
Funding position	Unconfirmed	Institutional or VC equity funding is official for Scale and the AI programme	Tier eligibility undetermined	Determine factually whether qualifying equity funding exists; if not, plan for the Start tier	Founder or CEO	Critical	Public links to the round, or a documented decision that no qualifying funding exists	Not started
Public website	Unconfirmed	A publicly available company website is official	Possible hard blocker	Publish a live Antutive website on the company domain	Founder with web owner	Critical	Live URL	Not started
Company-domain email	Unconfirmed	Business email must match the website domain	Possible hard blocker	Create and use a mailbox on the Antutive domain	Founder	Critical	Working email address	Not started
Billing account alignment	Unconfirmed	Website, email and billing-account email domains must all match	Credit approval blocked if misaligned	Create the Google Cloud account using the company-domain email and record the 18-character billing ID	Technical lead	Critical	Billing account ID and screenshot of the alignment	Not started
Prior credit history	Unconfirmed	Not more than US\$5,000 for Scale and AI; nothing beyond free trial for Start	Eligibility risk	Audit all Google Cloud accounts and promotional credits ever received by the company or its founders on company accounts	Technical lead	Critical	Written credit history	Not started
Excluded-category check	Assumed clear	Agencies, consultancies and dev shops are excluded	Positioning risk if any consulting revenue exists	Confirm Antutive earns no services revenue and that no public material reads as services	Founder	High	Website copy review	Not started
AI-first evidence	Concept only	AI must be foundational, judged case by case	Nothing public demonstrates it	Publish product and technology pages that make the	Founder with product lead	Critical	Live pages	Not started

Area	Current known status	Official requirement or recommendation	Gap	Required action	Suggested owner	Priority	Evidence required	Completion status
				Gemini dependency explicit				
Terminology	Refers to Vertex AI	Google's reviewed pages use Gemini Enterprise Agent Platform	Terminology mismatch in the application	Update all internal and public material to current Google naming	Technical lead	High	Updated documents	Not started
Product evidence	None confirmed	Not required, strongly recommended	A reviewer cannot see a working product	Produce real screenshots and one end-to-end demo of a genuine AI flow	Product lead	High	Screenshots and video URL	Not started
Architecture documentation	None	Not required, strongly recommended	Cannot answer technical follow-up or forecast spend	Produce a one-page architecture and data-flow document	Technical lead	High	Architecture document	Not started
Cloud-spend forecast	None	Not required, essential in practice	Credit exhaustion and post-credit shock risk	Build the six and twelve month forecast framework in section 22	Technical lead with finance	High	Forecast model with stated assumptions	Not started
Legal pages	Unconfirmed	Not a Google requirement; likely a legal obligation	Legal exposure and reduced credibility	Publish Privacy Policy, Terms and Conditions and cookie handling, reviewed by a qualified adviser	Founder with legal adviser	Critical	Published pages with effective dates	Not started
Privacy and children's data	Unconfirmed	Not a Google requirement; jurisdictional obligations likely	Significant compliance risk for a family product	Obtain qualified advice on household and minors' data before any public beta	Founder with legal adviser	Critical	Written advice and documented design decisions	Not started
Security controls	Unconfirmed	Not a Google requirement; recommended	Cannot make security claims	Implement and document baseline controls, then publish only what is implemented	Technical lead	High	Security document	Not started
Responsible AI position	Missing	Recommended	Trust gap for a family product	Publish a responsible-AI page describing confirmation steps, limits and correction paths	Founder with product lead	Medium	Published page	Not started
Business model	Unconfirmed	Official criterion at Start tier	Start tier eligibility risk	Define and document the monetisation model	Founder	High	One-page business model	Not started

Area	Current known status	Official requirement or recommendation	Gap	Required action	Suggested owner	Priority	Evidence required	Completion status
Founder and team verifiability	Unconfirmed	Not required; recommended	Identity confidence gap	Publish founder profiles with external corroboration	Founder	Medium	Team page and external profiles	Not started
Country of primary business	Unsupplied	Discretionary ground for rejection	Unknown discretionary risk	Confirm the country and, if uncertain about acceptance, ask startup support before applying	Founder	Medium	Written confirmation	Not started
Post-credit sustainability plan	Missing	Not required; the terms make the company liable for all uncovered fees	Financial risk at credit expiry	Build the post-credit operating cost plan in section 22	Founder with finance	High	Written plan	Not started

18. Step-by-Step Action Plan

Phase 1 — Verify AI startup eligibility

Action	Priority	Dependency	Expected output	Responsible role	Evidence of completion
Confirm legal incorporation, exact legal name, jurisdiction and date	Critical	None	Confirmed company facts	Founder or CEO	Certificate of incorporation on file
Determine factually whether qualifying institutional equity funding exists, including any SAFE	Critical	None	A yes or no answer with evidence	Founder or CEO	Public links to the round, or a written note that no qualifying funding exists
Audit all Google Cloud credits ever received	Critical	None	Credit history statement	Technical lead	Written audit
Confirm Antutive is not in any excluded category and earns no services revenue	Critical	None	Category confirmation	Founder	Signed internal note
Confirm the country of primary place of business	High	None	Country confirmed	Founder	Internal record
Select the target tier	Critical	All of the above	Tier decision: Start tier at US\$2,000, or Scale tier with the AI uplift up to US\$350,000	Founder	Written decision
Re-verify all figures and criteria on the official pages immediately before applying	Critical	Tier decision	Confirmation that nothing changed	Founder	Dated screenshots of the criteria pages

Tier determination logic for Antutive. If Antutive has qualifying institutional or venture capital equity funding, with a pre-seed or seed round inside five years or a Series A inside twelve months, and was founded inside five years,

and has received no more than US\$5,000 in Google Cloud credits, then the Scale tier with the AI uplift is the correct target and the AI startup option should be selected on the form. If funding is absent, or comes only from angel, friends and family, crowdfunding, prize, private equity or government innovation grants, then on the current published criteria Antutive would not appear eligible for the Scale tier, and the appropriate target is the Start tier at US\$2,000, which additionally requires incorporation within 24 months, a working MVP, a clear business model, an intention to raise venture funding, and no Google Cloud credits beyond the free trial. On the evidence supplied, the Start tier is the more likely fit, but this cannot be confirmed.

Phase 2 — Prepare company evidence

Action	Priority	Dependency	Expected output	Responsible role	Evidence of completion
Assemble the company evidence pack from section 15	Critical	Phase 1	Single organised folder	Founder	Folder index
Create the company-domain business email	Critical	Domain owned	Working mailbox	Founder	Test email sent and received
Create the Google Cloud account with the company-domain email and record the 18-character billing ID	Critical	Business email	Billing ID recorded	Technical lead	Console screenshot
Verify that website domain, email domain and billing-account email domain all match	Critical	Website and billing account	Alignment confirmed	Technical lead	Written check
Document founder identities and roles	Medium	None	Founder record	Founder	Team page draft
Document the business model	High	None	One-page business model	Founder	Document
Prepare the funding verification links, or the documented absence of qualifying funding	Critical	Phase 1	Verification pack	Founder	Links list

Phase 3 — Improve the Antutive website, in priority order

Items 1 to 5 and item 14 correspond to the essential list in section 12.2 and should be complete before submission. Items 6 to 13 are recommended improvements that can follow the application.

Order	Action	Priority	Dependency	Expected output	Responsible role	Evidence of completion
1	Publish or confirm a live public website on the company domain	Critical	Domain and hosting	Live site	Founder with web owner	Live URL
2	Remove all placeholder content and any unverified claim about users, revenue, funding, partnerships or awards	Critical	Live site	Clean site	Founder	Content audit
3	Publish the AI-first positioning statement on the home page	Critical	Live site	Positioning live	Founder	Screenshot
4	Publish the Famant product page per	Critical	Product content	Product page live	Product lead	Live URL

Order	Action	Priority	Dependency	Expected output	Responsible role	Evidence of completion
	section 14					
5	Publish Privacy Policy, Terms and Conditions and cookie handling	Critical	Legal review	Legal pages live	Founder with legal adviser	Live URLs with effective dates
6	Publish the AI and Technology page naming Gemini and the Gemini Enterprise Agent Platform	High	Architecture plan	Technology page live	Technical lead	Live URL
7	Publish the About page with the legal company name and product-company framing	High	Phase 1	About page live	Founder	Live URL
8	Add real screenshots and a demo video	High	Product build	Media published	Product lead	Live media
9	Publish the Team page with founder profiles and external corroboration	Medium	Founder consent	Team page live	Founder	Live URL
10	Publish the Security and Privacy page describing only implemented controls	High	Controls implemented	Page live	Technical lead	Live URL
11	Publish the Responsible AI page	Medium	Product design decisions	Page live	Product lead	Live URL
12	Publish the roadmap or updates section with honest status labels	Medium	Roadmap agreed	Section live	Product lead	Live URL
13	Add the waitlist call to action with working confirmation	Medium	Form tooling	Working waitlist	Product lead	Test submission
14	Complete a mobile responsiveness and broken-link audit	High	All pages live	Audit report	Web owner	Report

Phase 4 — Improve the Famant product presentation

Action	Priority	Dependency	Expected output	Responsible role	Evidence of completion
Write the household problem and solution narrative	Critical	None	Approved copy	Product lead	Published copy
Apply an honest status label to every capability	Critical	Development status known	Labelled capability list	Product lead	Published list
Capture real screenshots of working screens only	High	Working build	Screenshot set	Product lead	Published images
Record one end-to-end demo of a genuine AI flow	High	Working build	Demo video	Product lead	Published video

Action	Priority	Dependency	Expected output	Responsible role	Evidence of completion
Describe the AI mechanism for each core capability, naming the Google model or service	High	Architecture plan	Mechanism descriptions	Technical lead	Published copy
State the beta or waitlist position accurately	Critical	Decision on access	Accurate status	Product lead	Published statement
Add security and privacy summaries with links	High	Controls documented	Summaries live	Technical lead	Published copy
Decide whether to publish pricing, and publish only if confirmed	Medium	Business model	Pricing decision	Founder	Written decision

Phase 5 — Prepare the Google Cloud architecture plan

Produce a single architecture document covering the items below. All of these are RECOMMENDATIONS; Google does not require an architecture document as part of the application.

Component	What to document	Priority
Gemini	Which models are used for which capability: assistant dialogue, task extraction, scheduling reasoning, document understanding, summarisation. Note that programme credits cover Google models such as Gemini and Gemma, that third-party models fall outside the regular allocation, and that a separate conditional partner-model credit of up to US\$10,000 in Model Garden may be available to qualifying Scale and Scale AI startups	Critical
Gemini Enterprise Agent Platform	Agent design and orchestration, tool and function definitions, retrieval and grounding on family data, evaluation, versioning and deployment. Use the exact current Google product names that match the planned architecture. Vertex AI remains an active Google Cloud product and should not be described as legacy	Critical
Cloud Run	Stateless services for the API, agent tools, document-processing workers and scheduled jobs; concurrency and minimum-instance settings, which directly affect credit burn	High
Cloud SQL	Relational store for households, members, tasks, events, lists and expenses; instance sizing, high availability decision and backup policy	High
Cloud Storage	Uploaded documents, receipts and invitations; lifecycle and storage-class policy, and retention aligned to the Privacy Policy	High
Firebase	Authentication, real-time collaboration and client delivery. Firebase usage is explicitly within the covered spend	High
Monitoring and logging	Google Cloud observability, log retention settings, alerting, and a deliberate decision on log volume because retention drives cost	High
Security	Identity and access management with least privilege, service accounts, secret management, encryption approach, network controls, and separation between family tenants	Critical
EU data residency	If EU residency is required, document the region choice for compute, database, storage and AI processing, and confirm regional availability for each service before committing. Regional availability of specific AI capabilities is not specified by Google on the reviewed startup pages and must be confirmed in the product documentation	High
Development environment	Isolated project, minimal always-on resources, aggressive shutdown of idle services	High
Staging environment	Separate project mirroring production topology at reduced scale,	Medium

Component	What to document	Priority
	used for evaluation runs and load tests	
Production environment	Separate project, defined scaling limits, budget alerts, and quota caps on AI calls	Critical
Project and billing structure	One billing account with separate projects per environment so that credit consumption can be attributed	High

Phase 6 — Prepare a cloud-spend forecast

Build the forecast as a model with explicit assumptions rather than as a single number. Do not present any figure as a Google estimate. Google publishes no cost estimates for startup workloads, and none are invented here.

Forecast dimension	What to model	Assumption to state explicitly
Six-month usage	Development plus limited private testing	Number of test households, sessions per household per week, documents uploaded per household per week
Twelve-month usage	Development, staging, production and a public beta	Growth path for active households and the retention assumption behind it
AI API consumption	Requests per capability, average input and output token volume, and whether context includes retrieved family data	Tokens per assistant turn, turns per session, documents processed per month, current published unit prices
Voice processing	Minutes of audio processed per household per month, if voice is implemented	Whether voice is in scope during the credit period
Document and OCR processing	Pages processed per month and reprocessing rate	Average pages per document
Storage	Gross document volume, growth rate, retention and storage class	Average document size and retention period
Database	Instance size, uptime hours, storage growth, high availability and backup	Whether high availability is enabled during the credit period
Compute	Cloud Run request volume, average duration, memory allocation and minimum instances	Whether minimum instances are kept warm
Monitoring and logging	Log ingestion volume and retention period	Log verbosity setting
Network	Egress volume, particularly document downloads and media	Egress per active household per month
Scaling scenarios	Base case, and a high case at three to five times the base	The trigger that would move usage to the high case
Credit consumption	Monthly burn against the year-one ceiling, and the year-two position where only 20% of usage is covered	Which tier was actually granted, and the exact expiry date shown in the console

Phase 7 — Prepare application answers

The exact fields of the credit-application step are not published, so the list below combines confirmed step-one fields with information any AI applicant should have ready. Items marked confirmed are actual form fields observed on 28 July 2026.

Likely question	Information needed	Source of certainty
First and last name	Applicant identity	Confirmed field
Business email	Company-domain email matching the website	Confirmed field
Business phone and country code	Company phone	Confirmed field
Company name	Exact legal name	Confirmed field
Industry	Best-matching option from Google's list	Confirmed field
Job role and job title	Applicant's role	Confirmed field

Likely question	Information needed	Source of certainty
Country	Country of primary business	Confirmed field
Are you an AI startup, a Web3 startup, or neither	Select AI startups	Confirmed field
Google Cloud billing account ID	The 18-character ID, aligned to the company-domain email	Confirmed prerequisite
Founding date	Incorporation date	Confirmed criterion, field not published
Funding stage, amount and date	Round type, date and investor	Confirmed criterion, field not published
Investor name and verification link	Public links evidencing the investment	Confirmed expectation
Prior Google Cloud credits received	Accurate figure	Confirmed criterion
What does your product do	Famant description with honest status labels	Not published; prepare anyway
How is AI core to your product	Capability-by-capability AI mechanism description	Not published; prepare anyway
Which Google AI services will you use	Gemini models and the Gemini Enterprise Agent Platform, with named roles	Not published; prepare anyway
Expected Google Cloud spend	Forecast from Phase 6	Not published; prepare anyway
Website URL	Live company-domain website	Confirmed requirement in substance

Phase 8 — Submit and follow up

Action	Priority	Dependency	Expected output	Responsible role	Evidence of completion
Final verification that all Phase 1 to 7 outputs are complete and accurate	Critical	Phases 1 to 7	Signed-off readiness checklist	Founder	Completed section 23 checklist
Re-read the current official criteria and the programme terms on the day of submission	Critical	None	Confirmation of current rules	Founder	Dated screenshots
Confirm that the person submitting has legal authority to bind the company	Critical	None	Written confirmation	Founder or CEO	Internal note
Sign in with the company-domain business account and submit the application	Critical	All above	Application submitted	Founder	Submission confirmation
Diarise the response window: a few business days normally, ten days or more if manually reviewed	High	Submission	Follow-up date set	Founder	Calendar entry
Respond promptly to any Google request for further information	High	Submission	Requested information supplied	Founder	Correspondence record
On acceptance, read the welcome email in full and record every benefit and its deadline	Critical	Acceptance	Benefit register with deadlines	Founder	Register
Record the exact Credit Expiration Date shown in the billing console	Critical	Credit issuance	Expiry date recorded	Technical lead	Console screenshot
Request the time-bound benefits early, including Workspace while the domain condition still holds, and apply	High	Acceptance	Benefits activated	Founder	Confirmations

Action	Priority	Dependency	Expected output	Responsible role	Evidence of completion
separately for the Maps benefit if needed					
Configure budgets, billing alerts and AI quota caps before scaling any workload	Critical	Credit issuance	Controls active	Technical lead	Console screenshots
Engage the Startup Success Manager and book an architecture review	Medium	Acceptance	Meeting held	Technical lead	Meeting notes
If rejected, contact the account manager or cloudstartupsupport@google.com for information before considering any further action	Medium	Rejection	Reason understood	Founder	Correspondence

19. Risk and Rejection Analysis
19.1 Official disqualifying conditions
These are stated by Google. If any applies, the application will not succeed for the tier concerned.
Condition Consequence Source — — — Company has listed publicly or been acquired Not accepted cloud.google.com/startup/faq Educational institution, government entity or nonprofit Not accepted cloud.google.com/startup/faq Personal blog or content business Not accepted cloud.google.com/startup/faq Dev shop, consultancy or agency Not accepted cloud.google.com/startup/faq Service agency or traditional small business, at Start tier Not accepted cloud.google.com/startup/pre-funded Cryptocurrency mining company Not accepted cloud.google.com/startup/faq Company distributing tokens contrary to regulatory guidance in its jurisdiction Not accepted cloud.google.com/startup/faq More than US\$5,000 in Google Cloud credits already received, for Scale and the AI programme Not eligible for that tier cloud.google.com/startup/early-stage, cloud.google.com/startup/ai Google Cloud credits received beyond the free trial, for Start tier Not eligible for that tier cloud.google.com/startup/pre-funded Founded more than five years ago, for Scale and the AI programme Not eligible for that tier cloud.google.com/startup/early-stage, cloud.google.com/startup/ai Founded more than 24 months ago, for Start tier Not eligible for that tier cloud.google.com/startup/pre-funded Funding only from private equity, government innovation grants, prize funding, crowdfunding, angel or friends and family Not eligible for Scale; may be evaluated for other tiers cloud.google.com/startup/early-stage, cloud.google.com/startup/faq Website domain does not match the email domain and the billing-account email domain Credits will not be approved cloud.google.com/startup/faq False information provided in connection with the account, impersonation, or multiple accounts created to obtain credits Incentives void, may be revoked, and Google may invoice at list price as if the incentives never applied cloud.google.com/terms/startup-program-tos Use of the services for cryptocurrency mining without Google's prior written consent Breach of the programme terms cloud.google.com/terms/startup-program-tos Acceptance of incentives improper under a contract with a government or government-controlled entity Void where prohibited cloud.google.com/terms/startup-program-tos
19.2 Conditional eligibility concerns
Concern Why it is conditional Mitigation — — — AI-first determination Google assesses AI-first status case by case at its discretion Make the Gemini and agent-platform dependency explicit and concrete in public material and in the application Geography Google may reject an application because of the country of primary business, and publishes no country list Confirm the country position with startup support before applying if there is any doubt No public website, or a website that does not look like a product company A public website is required and services positioning is excluded Publish a genuine product website before applying Stealth mode Funding must still be verified Arrange investor verification in advance Prior programme participation Only one incentive code may be redeemed unless Google approved otherwise in writing Contact the account manager or startup support before reapplying Participation in other Google Cloud promotional programmes Google may withhold benefits or stop issuing remaining incentives Avoid stacking promotional programmes without checking first Company age inconsistency between two official pages Five years versus ten years for Scale Treat five years as the safer eligibility assumption and confirm directly with Google Startup Support if Antutive is older than five years Workspace benefit condition The domain must not have been on a paid Workspace plan from within 31 days of applying to the day the benefit is requested, and annual Business Plus plans are excluded Decide the Workspace position before applying, not after
19.3 General application risks
Risk Impact Mitigation — — — Applying to the wrong tier The application is consumed and the programme agreement takes effect on submission Complete Phase 1 before touching the form Ineligible funding stage Rejection for Scale Determine the funding position honestly first and target Start tier if appropriate Missing incorporation evidence Cannot evidence company age if queried Obtain and file the certificate before applying Unclear AI-first positioning The AI uplift is refused even if the Scale tier is granted Publish concrete AI mechanism descriptions rather than adjectives AI as a minor product feature Characterised as a bolt-on layer and refused the AI uplift Ensure the product genuinely depends on AI and that the public material shows it Agency or consultancy positioning Outright exclusion Remove any services, consulting or bespoke-development language from public material Incomplete website Undermines identity verification and product credibility Complete the Phase 3 list before applying Missing company-domain email Credits cannot be

approved | Create the mailbox first | | Unverifiable founders | Slows or complicates review | Publish founder profiles with external corroboration | | Unverifiable product | Weakens the AI-first case | Publish real screenshots and one demo | | No product demo | Not disqualifying, but removes the strongest available evidence | Record one genuine end-to-end flow | | Inconsistent company information | Name, domain, country or role mismatches invite manual review | Use one canonical set of company facts everywhere | | Incorrect billing setup | Credits cannot be approved or land in the wrong account | Verify the 18-character ID and its email association before applying | | Unsupported geography | Discretionary rejection | Confirm in advance where possible | | Misleading claims | Incentives may be voided and invoiced at list price | Apply honest status labels everywhere and remove unverified claims | | Missing cloud-usage plan | Weak follow-up conversations and poor credit control | Complete Phases 5 and 6 | | Failure to satisfy programme terms | Participation may be revoked or terminated | Read the terms in full before submitting | | Dependence on credits without a post-credit plan | Service interruption or forced migration when credits expire | Build the post-credit plan in section 22 | | Assuming a clean two-year window | Credits may be issued in increments with an expiry date that does not match expectations | Record the actual Credit Expiration Date from the console | | Assuming year two is generous | Only 20% of year-two usage is covered, up to US\$100,000 | Model year two on the 20% basis | | Confidentiality breach | The terms restrict disclosure of non-public programme aspects | Do not publish non-public programme details in marketing material | | Investor-disclosure surprise | Google may share purchase and usage information with current investors | Ensure founders and investors understand this before accepting |

19.4 Recommended preparation risks

These are risks created by weak preparation rather than by Google rules: over-claiming product maturity in order to look ready; publishing an architecture the team cannot actually build; forecasting cloud spend without stated assumptions and then being unable to explain it; building a public beta before privacy advice has been obtained for a product that may hold children's information; and treating the credits as a budget rather than as a time-limited offset, which leads to architecture choices that are unaffordable at list price.

20. Internal Questions Antutive Must Answer

None of these questions is answered by the supplied context, and no answer has been assumed. Each should be answered in writing before an application is submitted.

Company and legal 1. Is Antutive legally incorporated? 2. What is the exact legal company name, as it appears on the register? 3. In which country is Antutive incorporated, and where is its primary place of business? 4. What is the incorporation date, and does it fall within five years, and within 24 months? 5. Who has legal authority to accept the Google Cloud Startups Program terms on behalf of the company? 6. Does Antutive earn, or intend to earn, any services, consulting or bespoke-development revenue that could cause it to be classified as an agency, consultancy or dev shop?

Funding 7. Has Antutive received equity funding? 8. If so, what is the funding amount, the round type and the closing date? 9. Who are the investors, and are they institutional investors or venture capital firms? 10. Is any of the funding a SAFE, and is it documented? 11. Is any of the funding from angel investors, friends and family, crowdfunding, prize funding, private equity or a government innovation grant? 12. Is the funding verifiable through publicly available online sources, and if not, will the investor confirm it directly? 13. Is Antutive associated with an accelerator, and is that participation confirmed?

Google Cloud position 14. Has Antutive, or any founder acting for Antutive, previously received Google Cloud credits, and how much? 15. Has Antutive participated in any other Google Cloud promotional programme? 16. Does Antutive have an active Google Cloud billing account, and what is the 18-character ID? 17. Is the billing account associated with a company-domain email that matches the public website domain? 18. Which Google Cloud services are already in use, if any? 19. Which Google Cloud services are planned, and in which environments? 20. Is EU or other regional data residency required, and has regional availability been confirmed for every service in the plan?

Product 21. Does a public Antutive website exist on the company domain? 22. What is Famant's current development stage, capability by capability? 23. Is a working beta available, and if so to whom? 24. Are there active beta users, and how many exactly? 25. What is the waitlist size, if a waitlist exists? 26. Is there any revenue? 27. Is there a product demo that shows a genuine end-to-end AI flow? 28. Which Famant capabilities depend on Gemini today, and which are only planned? 29. What is the business model, and is it documented? 30. Has privacy advice been obtained regarding household data and any data relating to children?

Financial and operational planning 31. What is the projected six-month Google Cloud spend, and on what assumptions? 32. What is the projected twelve-month Google Cloud spend, and on what assumptions? 33. Who will submit the application? 34. Who will own and administer the Google Cloud billing account? 35. Which product and technical milestones will be completed during the credit period? 36. How will infrastructure costs be paid after the credits expire, and from which source? 37. What is the maximum monthly Google Cloud cost Antutive could sustain from its own resources today?

21. Recommended Application Narrative

This is a factual framework, not finished copy, and every bracketed instruction must be replaced with a verified fact or removed. Nothing here asserts customers, users, revenue, funding, investors, partnerships, launch dates, awards or product completion.

What Antutive is. Antutive is an AI-first product company building AI-native software products. Its focus is the household: the coordination work that families do every day and that current tools do not reduce. State the legal entity name, jurisdiction and founding year only once confirmed.

What Famant is. Famant is Antutive's AI-powered family-management and household-coordination platform. It brings a family's schedule, tasks, lists, documents and household spending into one shared context, and provides an assistant that can read that context, propose actions and carry them out once a family member confirms. State the current development stage plainly, using a label such as under development or in private testing.

What problem Famant solves. Household coordination is fragmented and the work is invisible. Calendars sit in separate accounts, tasks live in messages, school and medical documents arrive as paper or PDFs, and spending is tracked separately if at all. The result is that one or two people carry the coordination load and important things are missed. The difficulty is not storage; it is interpretation, prioritisation and follow-through, which is exactly the class of work generative models are suited to.

Why Famant is an AI-first product. Remove the AI from Famant and there is no product left, only another shared calendar and list app. The assistant is the interface. Scheduling proposals depend on reasoning over family context rather than on rules. Conflict detection requires understanding the meaning of commitments, not just their time ranges. Task creation and delegation depend on interpreting requests and documents. Document intelligence and OCR turn unstructured household paperwork into actions. The dashboard is assembled by prioritisation rather than by a fixed layout. Present this as the structural argument, and match it to the capability status labels so that planned capabilities are not presented as built.

How Gemini may be used. Describe intended roles precisely: assistant dialogue and instruction following; extraction of tasks, dates, amounts and participants from documents and messages; reasoning over the household schedule to propose times and to explain detected conflicts; summarisation for the daily dashboard; and multimodal understanding of photographed receipts and invitations. Note that programme credits cover Google models such as Gemini and Gemma, and that third-party models fall outside the regular credit allocation, which is a reason to standardise on Google models. Note also, accurately rather than as an absolute exclusion, that qualifying Scale and Scale AI startups may separately receive up to US\$10,000 in credits for partner models in Model Garden, including Anthropic, Mistral and AI21.

How the Gemini Enterprise Agent Platform may be used. Describe intended use for agent definition and orchestration, tool and function calling into Famant's own services, grounding and retrieval over the family's own data, evaluation of assistant quality against a fixed test set, versioned deployment, and monitoring of model behaviour in production. Use the exact current Google product names that match the planned architecture. Vertex AI remains an active Google Cloud product and should not be described as legacy, so name whichever platform genuinely matches the intended build, and verify the naming again immediately before applying.

How Google Cloud may be used. Cloud Run for the API and asynchronous document-processing workers; Cloud SQL for the relational household model; Cloud Storage for uploaded documents with a defined retention policy; Firebase for authentication, real-time collaboration and client delivery; Google Cloud observability for logging, metrics and alerting; and Google Cloud security services for identity, secrets and key management. Separate development, staging and production projects under one billing account.

Why cloud credits would accelerate development. Be specific and modest. Credits would allow the team to run a real evaluation loop over the assistant rather than a minimal one; to process realistic document volumes in testing instead of a handful of samples; to run a private beta with genuine households on production-grade infrastructure rather than on a single constrained instance; and to build on managed services rather than on the cheapest possible substitutes that would later have to be replaced.

What milestones could be achieved during the credit period. Frame as intentions, not commitments: a working assistant covering an agreed set of capabilities; a document pipeline handling the priority document types; a measurable evaluation baseline for assistant quality and conflict-detection accuracy; a private beta with a defined number of households; a documented security and privacy posture; and a defined pricing model. Do not state dates unless they are certain.

How the product may scale. Stateless services on Cloud Run scaling with request volume; the relational store scaled vertically first and then by read replicas; document processing decoupled through asynchronous workers so that spikes do not affect interactive latency; and AI cost controlled by routing simple requests to smaller Gemini models and reserving larger models for genuinely complex reasoning.

How Antutive intends to sustain infrastructure costs after credits expire. State the plan honestly, including that year two covers only 20% of usage up to US\$100,000 and that the company is responsible for everything beyond the credits. Identify the intended source of ongoing funding, whether subscription revenue, external investment, or founder funding, and state the cost-per-household target the product must reach to be viable at list price. If this is not yet modelled, say that it is being modelled rather than inventing a figure.

22. Six-Month and Twelve-Month Credit Strategy
All figures in this section are placeholders that Antutive must replace with its own modelled values. No cost estimate is asserted here, because Google publishes none for these workloads and inventing one would be misleading. Every percentage split below is a planning proposal from this analysis, not a Google rule.
22.1 Allocation framework
The purpose of an allocation framework is to stop the credit balance being consumed by things that do not advance the product. The proposal below allocates by purpose rather than by service.
Purpose Months 1 to 6, proposed share of credit burn Months 7 to 12, proposed share Rationale — — — — Development environment Small and strictly capped Small Development should be the cheapest environment; it is the most common source of silent waste Staging environment Moderate, concentrated in evaluation and load-test windows Moderate Needed for evaluation runs and pre-beta load tests, not needed continuously Production environment Growing from minimal to the majority Majority Production should dominate spend only once real households are using the product Gemini model usage Significant and closely metered Significant The core product cost; also the most volatile Agent platform usage Moderate, rising with agent complexity Moderate to significant Orchestration, grounding and evaluation Cloud Run Small to moderate Moderate Scales with request volume; minimum instances are the main fixed cost Cloud SQL Moderate and fairly fixed Moderate Largely a function of instance size, uptime and high-availability choice Cloud Storage Small, growing Small to moderate Grows with document volume and retention policy Firebase Small to moderate Moderate Authentication and real-time usage scale with active households Logging and monitoring Small if configured deliberately, large if not Small Log volume and retention are the levers Security services Small Small Keys, secrets and scanning Testing and evaluation Moderate, in defined windows Moderate Evaluation runs are AI-heavy and should be batched and budgeted Beta launch Not applicable early Moderate Onboarding real households increases both AI and infrastructure usage Scaling headroom Reserve, unspent Reserve Deliberate unallocated buffer for unexpected demand
22.2 Monitoring credit consumption
Check the credit balance and the Credit Expiration Date directly in the Google Cloud billing console rather than relying on assumptions about a two-year window, because Google may issue credits in increments and the expiry date shown in the console governs. Review consumption weekly during development and daily during any beta launch window. Attribute spend by project so that development, staging and production burn can be separated, and attribute AI spend by capability using labels so that the true cost of each Famant feature is visible. Google states it is not required to notify a company when credits are exhausted, so the company must monitor this itself.
22.3 Budgets, alerts and quota caps
Configure a budget per project, not only one for the billing account, so that a runaway development job is visible immediately. Set alert thresholds well below the ceiling, for example at 25%, 50%, 75% and 90% of the planned monthly burn, and route alerts to a channel a human actually reads. Set hard quota limits on AI request volume per environment so that a loop in a test harness cannot consume a month of budget overnight. Set per-request and per-session token ceilings in application code, and enforce a maximum context size rather than letting retrieved family context grow without limit. Cap document size and page count on upload. Add an application-level daily spend guard that degrades gracefully, for example by queuing non-urgent document processing, rather than failing.
22.4 Preventing unexpected charges
The most common causes of unexpected AI spend are retry loops without backoff, evaluation harnesses left running, oversized context windows, reprocessing the same documents repeatedly, verbose logging with long retention, and minimum instances left configured in non-production environments. Address each deliberately: implement exponential backoff and a retry ceiling; make every evaluation run time-boxed and explicitly triggered; cache document extraction results so a document is processed once; set log retention to the shortest period compatible with debugging and compliance; and keep minimum instances at zero outside production.
22.5 Avoiding unnecessary accelerator usage
Famant as described does not require model training. It consumes managed Gemini models, which means GPU and TPU provisioning should not be needed at all. Because accelerators are not a separate benefit and consume the same credits at list price, the correct policy for Antutive is

a deliberate one: no GPU or TPU provisioning unless a specific, written technical justification exists. If fine-tuning is later considered, evaluate whether prompt design, retrieval and grounding achieve the same outcome first, since those are far less expensive.
22.6 Preventing development environments from wasting credits
Give development its own project with a hard budget. Use the smallest viable database instance and stop it outside working hours. Keep Cloud Run minimum instances at zero. Use smaller Gemini models in development wherever the behaviour under test does not depend on the larger model. Use fixture data rather than large synthetic document sets. Delete orphaned storage buckets, unused images and stale test data on a schedule. Assign one named person responsibility for the development budget.
22.7 Avoiding permanent dependence on credits
Treat the credit period as a runway with a fixed end date, and instrument the product so that the true unit cost of serving one household per month is known before the credits expire. That single number is the bridge between the credit period and commercial viability. Set a target unit cost early, measure it monthly, and treat any architecture decision that worsens it as a decision requiring justification. Aim to reach a state where the product could run at list price on a defensible margin, even if it is not yet doing so.
22.8 Preparing for post-credit operating costs
Model three positions and state the assumptions behind each: the year-one position with 100% coverage up to the granted ceiling; the year-two position with only 20% of usage covered up to a further US\$100,000, which means the company pays roughly four fifths of usage; and the post-programme position at full list price with no coverage. Identify the specific cost reductions available at that point, for example committed-use discounts, smaller model routing for routine requests, more aggressive caching, shorter log retention, storage lifecycle transitions, and consolidation of environments. Decide in advance which of those levers will be pulled and in what order.
22.9 How revenue or external funding may support continued operations
State the intended path honestly rather than optimistically. If subscription revenue is the intended source, the target is a price point and household count at which gross margin covers infrastructure at list price, and that target should be derived from the measured unit cost rather than chosen first. If external funding is the intended source, the credit period should be used to build the evidence a funder will ask for, which is a working product, measured assistant quality, real household usage and a credible unit-cost curve. If founder funding is the interim source, state the monthly ceiling it can sustain and design the architecture to fit inside it. Note that Google's programme provides no continuation of coverage and no committed discount beyond the programme, so no part of the plan should assume Google intervention. It is also worth noting that Google operates a separate equity-funding vehicle for AI founders, referenced on its startup resources page, which is a distinct application and was not analysed in this report.

23. Final Application-Readiness Checklist

Mark each item only when the evidence exists. Items marked with an asterisk are official Google requirements or conditions; unmarked items are recommendations from this analysis.

Company - ☐ Exact legal company name confirmed and used consistently everywhere - ☐ Country of incorporation and primary place of business confirmed - ☐ Company is not in any excluded category - ☐ No services, consulting or agency positioning anywhere in public material - ☐ Authorised signatory identified for the programme terms *

Incorporation - ☐ Certificate of incorporation obtained and filed - ☐ Incorporation date confirmed - ☐ Company age checked against the five-year rule for Scale and the AI programme - ☐ Company age checked against the 24-month rule for Start tier * - ☐ Registration details published where lawful

Founders - ☐ Founder names and roles documented - ☐ Founder profiles published with external corroboration - ☐ Applicant's job role and job title confirmed for the form *

Team - ☐ Real team members listed, with no intended hires presented as staff - ☐ No adviser or investor listed without consent

Funding - ☐ Funding position determined factually, including any SAFE - ☐ Round type and closing date confirmed against the pre-seed and seed five-year window or the Series A twelve-month window - ☐ Public links evidencing the equity investment assembled - ☐ Non-qualifying funding sources identified and their effect on tier understood - ☐ Investor verification arranged if the company is in stealth *

Investor or accelerator status - ☐ Investor names and institutional status confirmed - ☐ Accelerator participation confirmed only if real - ☐ Investor-disclosure clause in the programme terms understood by founders and investors

AI startup eligibility - ☐ AI confirmed as foundational to the product rather than a bolt-on layer - ☐ Gemini usage or a concrete plan to use Gemini documented - ☐ Gemini Enterprise Agent Platform usage or plan documented - ☐ Google product naming verified against the current official pages on the day of submission, using the exact names that

match the planned architecture, noting that Vertex AI remains an active product and is not legacy - [] AI startup option identified for selection on the application form

Website - [] Publicly available company website live on the company domain - [] *Company-domain business email working and matching the website domain* - [] Billing-account email domain matching the website and business email domain - [] *All placeholder content removed* - [] All unverified claims about users, revenue, funding, partnerships and awards removed * - [] AI-first positioning visible on the home page - [] About, Products, Technology, Team, Contact and legal pages published - [] Mobile responsiveness verified - [] Broken-link audit completed

Product - [] Famant product page published per section 14 - [] Every capability carries an honest status label - [] *Business model documented* (official criterion at Start tier) - [] Working MVP confirmed if applying to Start tier - [] *Beta or waitlist position stated accurately*

Demo - [] Real screenshots published, with no mock-up presented as product * - [] One end-to-end demo of a genuine AI flow recorded and published

Gemini - [] Model roles mapped capability by capability - [] Understanding recorded that the regular credit allocation covers Google models and not third-party models, and that a separate conditional partner-model credit of up to US\$10,000 in Model Garden may be available to qualifying Scale and Scale AI startups * - [] Token and context limits enforced in application code

Agent platform - [] Agent, tool and grounding design documented - [] Evaluation approach and test set defined - [] Deployment and versioning approach defined

Google Cloud architecture - [] Architecture and data-flow document produced - [] Separate development, staging and production projects under one billing account - [] Region and data-residency decisions made and regional availability confirmed for every service - [] 18-character billing account ID recorded *

Security - [] Least-privilege identity and access management implemented - [] Secrets and key management implemented - [] Tenant separation between families implemented - [] Only implemented controls described publicly *

Privacy - [] Privacy Policy published with an effective date - [] Data categories, retention and processors documented, including Google Cloud - [] Model-data flows disclosed, including whether data trains models - [] Qualified privacy advice obtained on household data and any data relating to children

Responsible AI - [] Responsible AI page published - [] Human confirmation required before consequential automated actions - [] Model limitations and correction paths documented

Legal - [] Terms and Conditions published - [] Cookie Policy and consent mechanism in place where required - [] Google Cloud Startups Program terms read in full - [] *Confidentiality obligation understood* - [] No cryptocurrency mining use, and no improper government-contract interaction *

Technical documentation - [] Architecture document complete - [] Environment and project structure documented - [] Evaluation methodology documented

Cloud-spend forecast - [] Six-month forecast built with stated assumptions - [] Twelve-month forecast built with stated assumptions - [] Year-two 20% coverage modelled explicitly - [] *Post-programme list-price position modelled* - [] Unit cost per household per month defined as a tracked metric

Application form - [] Signed in with the company-domain business account - [] *All step-one fields prepared* - [] Prior Google Cloud credit history disclosed accurately - [] *Target tier selected deliberately* - [] Official criteria pages re-read on the day of submission *

Final review - [] All company facts consistent across website, email, billing account and application - [] *No misleading claim anywhere in the application or on the website* - [] Response window diarised * - [] Named person responsible for responding to Google follow-up

Post-acceptance preparation - [] Welcome email read in full and every benefit and deadline recorded - [] *Credit Expiration Date recorded from the billing console* - [] Workspace benefit requested while the domain condition still holds - [] *Maps Platform benefit applied for separately if needed* - [] Enhanced Support and Skills credits activated - [] *Budgets, alerts and AI quota caps configured before scaling* - [] Startup Success Manager engaged and an architecture review booked

Post-credit sustainability - [] Unit cost per household measured and tracked - [] Cost-reduction levers identified and prioritised - [] Funding source for post-credit infrastructure identified - [] Maximum sustainable monthly cloud cost defined - [] Decision point diarised at least three months before credit expiry

24. Final Recommendation

Best-fit AI startup tier. Conditional. If Antutive holds qualifying institutional or venture capital equity funding, was incorporated within the last five years, and has received no more than US\$5,000 in Google Cloud credits, then the correct target is the Scale tier with the AI startup uplift, worth up to US\$350,000 over two years, applying with the AI startup option selected. If qualifying institutional equity funding does not exist, then based on the current published eligibility criteria Antutive would not appear eligible for the Scale AI tier, final eligibility remaining at Google Cloud's discretion, and the appropriate target is the Start tier at US\$2,000 valid for twelve months, which additionally requires incorporation within the last 24 months, a working MVP, a clear business model, an intention to raise venture funding, and no Google Cloud credits beyond the free trial. On the information supplied, the Start tier is the more probable fit, but this cannot be confirmed.

Eligibility confidence level. Low at present, and this reflects missing information rather than a negative assessment. The product concept aligns well with Google's AI-first framing. Every gating fact that Google actually checks is unverified.

Major blockers. Unconfirmed legal incorporation and incorporation date; unconfirmed funding position, which alone determines whether the US\$350,000 route exists; unconfirmed existence of a public company website, which is a stated requirement; unconfirmed company-domain email and its alignment with the website and the Google Cloud billing account, which Google states must match for credits to be approved; unconfirmed prior Google Cloud credit history; and an unconfirmed country of primary business, which Google may treat as a discretionary ground for rejection.

Information requiring verification. The full list is in section 20. The five that must be answered first are: is Antutive incorporated and when; does qualifying institutional equity funding exist; does a public website exist on the company domain; is there a company-domain email aligned with the billing account; and how much Google Cloud credit has already been received.

Highest-priority website changes. Publish or confirm a live public website on the company domain, with the website, business email and billing account all on that same domain. Remove all placeholder content and every unverified claim about funding, users, partnerships or product completeness. Publish the AI-first positioning on the home page and remove any agency or consultancy framing. Publish the Famant product page with honest status labels on every capability. Publish working Privacy Policy and Terms and Conditions pages, and clear company and contact information. These are the items that should be complete before submission. The AI and Technology page, and the other pages set out in sections 12.3 and 13, are recommended rather than required and can follow.

Highest-priority product changes. Apply an honest status label to every Famant capability. Produce real screenshots of working screens only. Record one end-to-end demo of a genuine AI flow, such as uploading an invitation and confirming the resulting event and reminder. Document the AI mechanism behind each core capability, naming the Google model or service that performs it.

Highest-priority company actions. Confirm incorporation and obtain the certificate. Determine the funding position factually. Create the company-domain email and the Google Cloud billing account from that email, then verify domain alignment across website, email and billing account. Audit prior Google Cloud credits. Obtain qualified privacy advice before any public beta, given that households may include children.

Is Antutive ready to apply? No, not on the information available. Applying now would risk consuming the application while several stated requirements are unverified, and submission itself brings the programme agreement into effect.

Is further preparation recommended? Yes. The preparation is mostly administrative and factual rather than technical, and much of it can be completed quickly. The two items with a genuine lead time are publishing a credible website with legal pages, and producing a real demo of one working AI flow.

What must be completed before submission. Confirmed incorporation and date. A determined funding position and, for a Scale tier application, public links verifying the round. A live public company website on the company domain with no placeholder or misleading content. A working company-domain email matching the website domain. A Google Cloud account and 18-character billing ID whose associated email domain matches. An audited prior-credit position within the tier limit. A documented Gemini and agent-platform plan. A cloud-spend forecast with stated assumptions. Published Privacy Policy and Terms and Conditions. A deliberate tier decision, with the official criteria re-read on the day of submission.

Conditional recommendation. Complete Phases 1 and 2 of the action plan and the critical items of Phase 3 first. Then re-test eligibility against the criteria as they stand on that date. If institutional equity funding is confirmed, apply to the Scale tier selecting the AI startup option and prepare specifically for the AI-first assessment. If it is not, apply to the Start tier, use the US\$2,000 and the free AI Studio tier to build the demonstrable product and evaluation baseline, and treat the Scale tier and AI uplift as a later objective to be pursued once a qualifying round closes, subject to the five-year company age limit and the US\$5,000 prior-credit limit still being satisfied at that time.
